RADIOACTIVE WASTE MANAGEMENT

Research Programme 1985/86

DoE Report No. DoE/RW/86.

Contract Title: Studies of large and local scale advection and dispersion relevant to the Great Meteor East Location.

DoE Reference: PECD7/9/216

Report Title: CTD data from the Madeira and Iberian Abyssal Plains. C. DARWIN Cruise 3/85 and 9A/85.

Author: P.M. SAUNDERS

Date of submission to DoE: 1 March 1986

Period covered by report:

Abstract (100-200 words as desired)

This report presents lists and graphs of CTD data taken aboard RRS Charles Darwin on cruises 3 (May 1985) and 9A (November 1985). The majority of the lowerings were made in support of two experiments; the deployment of deep SOFAR floats and of deep moored current meters, the latter near 31°30'N 25°W (GME site). All CTD data is compared with reversing thermometer observations, and with determinations of salinity and dissolved oxygen derived from samples.

Keywords: 126,299 - Ocean circulation/dispersal, DoE sponsored research.

This work has been commissioned by the Department of the Environment as part of its radioactive waste management research programme. The results will be used in the formulation of Government policy, but at this stage they do not necessarily represent Government policy.

THE COLLECTION OF CTD DATA

The data described in this report was gathered aboard Cruises 3 and 9A of the RRS Charles Darwin in 1985. Cruise 3 sailed from Funchal, Madeira and docked in Falmouth, U.K. (26 April - 14 May) and Cruise 9A sailed from Funchal and docked in Lisbon, Portugal (15 - 28 November). Dr. W.J. Gould was the principal scientist for both cruises. The number of CTD stations on each cruise was quite limited so the data from both are combined in this report.

CTD stations were made with a NBIS instrument equipped with a Beckman dissolved oxygen sensor, 1 m path transmissometer from Sea Tech, Inc. and General Oceanics Multisampler, the latter alongside the CTD. The equipment is shown in figure 1 of Saunders, 1985a. Lowerings were made from the mid-ships winch with maximum ascent and descent rates of 1 m/s. A general description of our procedures will be found in earlier data reports (e.g. Saunders, 1985b) and in a review article (Saunders, 1985a).

The stations were made in both the Canary and Iberian basins (see figure 1). Those in the Canary Basin (Cruise 9, stns. 1-4) were made near the Great Meteor East Study site (GME) in conjunction with long-term current meter measurements (Saunders, 1986). Those in the Iberian basin (Cruise 3, stns. 2-7 and Cruise 9 stns. 5-8) were made in support of a 2000 m SOFAR FLOAT experiment which is being carried out jointly by IOS and MAFF (Lowestoft) personnel. Table 1 gives details of the measurements and their locations. All of this research programme is part of an evaluation of the potential of the deep ocean (sediments) as a repository for heat generating radioactive waste.

RECONCILIATION OF CTD DATA WITH MULTISAMPLER DATA

(a) Pressure

The calibration equation used on both cruises was:-

$$p = 0.1 p_{raw} - 11.0$$

Differences between the pressure measured by the CTD and by pairs of reversing thermometers are shown in Table 2. The

results are similar to previous experience (Saunders 1985a) and confirm the stability of the CTD sensor.

(b) Temperature

The calibration equation used on both cruises was:-

$$T = .00049953 \text{ Traw} + .026$$

It was based on laboratory calibrations made in January and June 1985 which confirmed the stability of the platinum resistance sensor since its introduction into use. A comparison is shown in Table 2 between CTD temperatures and reversing thermometers, separating the deep and shallow measurements.

(c) Salinity

The sample measurements made on this cruise, with a Guildline Autosal, were generally within .001 of the canonical θ -s relation, $S = 34.698 + 0.098\theta$. (θ is the potential temperature). Standard sea-water batch numbers P96 and P99 were used for standardisation of the bench salinometer on Cruises 3 and 9A respectively. The cell factor required to bring the CTD salinities into agreement with the above equation in the interval $2.1 < \theta < 2.3$ for each station is listed in Table 1. On Cruise 3 had we chosen a constant cell factor of 0.9996 the range of salinities at fixed θ for stations 3 and 7 would be .025, an order of magnitude larger than the variation shown by the sample salinities. This instability in the conductivity cell manifest itself on Cruise 9 when on stations 2-4 excessive noise was observed (principally on the up cast). On station 5 the conductivity sensor was first removed and then replaced (because of an accident to the spare). Reinstalled, its cell constant was markedly different! Possibly because of this malfunctioning cell the shallow salinity comparisons between CTD archived lists and sample values show poorer agreement than we have come to expect (see Table 2).

(d) Oxygen

Oxygen was calculated by lagging temperature (not current) as described in an earlier report (Saunders, 1980) on the ship-borne computer. Ashore (piecewise) corrections were made to each station to bring the CTD data to agree with sample values, see Table 2. Because of low quality the oxygen data was discarded from Cruise 3.

(e) Transmittance

Light transmittance was dealt with in the manner described in Saunders and Manning, 1984 for Cruise 3. No observations were made on Cruise 9A.

PROCESSING OF CTD DATA

The Plessey 68000 computer system on board the RRS Charles Darwin archives the data on 9 track computer tape. The data is already edited, averaged to 1 second interval and provisionally calibrated (though raw averaged data can be archived). Numerous derived quantities are also calculated. We elected to utilise the calibrated data p, T, S, DO and Tran merely commenting here that it is crucial to make note of the calibration equations and constants which are not stored with the archived data. (One advantage of a linear calibration treatment is the ease with which raw data is recovered!).

Ashore the data is transferred into the GEXEC file handling package on the Honeywell 66/DPS-300 at IOS Bidston. The computation path (as applied to Cruise 9A data) is described in general terms in Table 3 and in more detail in the appendix. The real time editing techniques (along with the quality of the data) yielded almost error-free observations on Cruise 9A and no editing procedure is explicit in the data processing path. For Cruise 3 editing was required ashore but the system was then (and to a lesser extent still is) under course of development.

Standard plots and lists occupy the main body of the report. Derived quantities, both aboard ship and ashore, have been computed from algorithms published in UNESCO Technical Paper on Marine Science No. 44 (Fofonoff and Millard, 1983). Because of our interest in the deepest parts of the water column we have included plots of variables below 3500 db at an expanded scale. See Saunders (1985b) for a discussion of their significance.

ACKNOWLEDGEMENTS

I am grateful to J. Moorey (Salinity, thermometry, dissolved oxygen), J. Smithers (CTD) and RVS personnel from Barry (CTD logging) who were involved in work at sea. Dr. W.J. Gould was the chief scientist for both cruises and his contribution is also gratefully acknowledged.

| Salinity, PSU | 0-2000db | -.011 | .010 | 22 |
| | 2000-6000db | -.001 | .003 | 35 |
| Oxygen, ml/l | 0-2000db | -.02 | .07 | 17 |
| | 2000-6000db | +.03 | .06 | 20 |

Data from both cruises combined in the above table.

The depth of the 5°C isotherm is approximately 1800db.

TABLE 3

Processing Path (See Appendix for further details)

Stage

- 1 Transfer CTD 1 second data from ship to shore computer.
- 2 Copy down cast to named file.
- 3 Sort data on pressure and average by 2db intervals.
- 4 Calculate salinity correction ratio.
- 5 Correct both salinity and oxygen.
- 6 Fill data gaps at start of lowering (and elsewhere).
- 7 Correct variable names and summary file entry.
- 8 Archive 2db data to tape in GF3 format.
- 9 Plot T, S, DO versus P (0-2000db).
- 10 Plot θ, S, Potran versus P (>3500db).
- 11 Construct a station list.
