PEATLAND ECOLOGY IN THE BRITISH ISLES: A BIBLIOGRAPHY

During the last twenty years there has been a rapid increase in the publication of ecological papers. This bibliography is intended to facilitate access by research workers to the large volume of published material dealing with the ecology of British and Irish peatlands, and also to provide those concerned with nature conservation with access to information on individual peatland sites.

The bibliography is intended to be as comprehensive as possible and to include all relevant material published prior to 1979. However there are probably some omissions of earlier work and also of papers published in local natural history society journals. It is inevitable that during the preparation of such a large bibliography there will be some mistakes, and we would be grateful if any errors or omissions could be notified to Dr. David Goode, at the Nature Conservancy Council.

The references are listed under 17 subject headings, and there is a cross-referencing system to enable the reader to locate references containing information on several topics. In addition there are author, species and site indexes. The contents of the sections are largely self-evident. However sections A and B, the regional accounts of peat deposits and vegetation descriptions, include only those references which deal in general terms with a large area; references which include information on the vegetation of a number of sites, or a restricted locality will be found in section C. Section D, peat development and stratigraphy includes only papers relating to peatland sites and does not include papers dealing with interglacial, marine, or lake basin peat deposits. The sections on hydrology and chemistry include only those papers that are predominantly concerned with these topics, but if a reference giving a site description also contains information on the hydrology or chemistry of a specific site, it will be cross-referenced to the appropriate section. The bibliography does not include reports of societies' field meetings or county floras of either bryophytes or vascular plants. The majority of the entries have been seen by one of the authors, with the exception of the post-graduate theses which consequently are indexed using information contained in the titles. Undergraduate theses are not included.

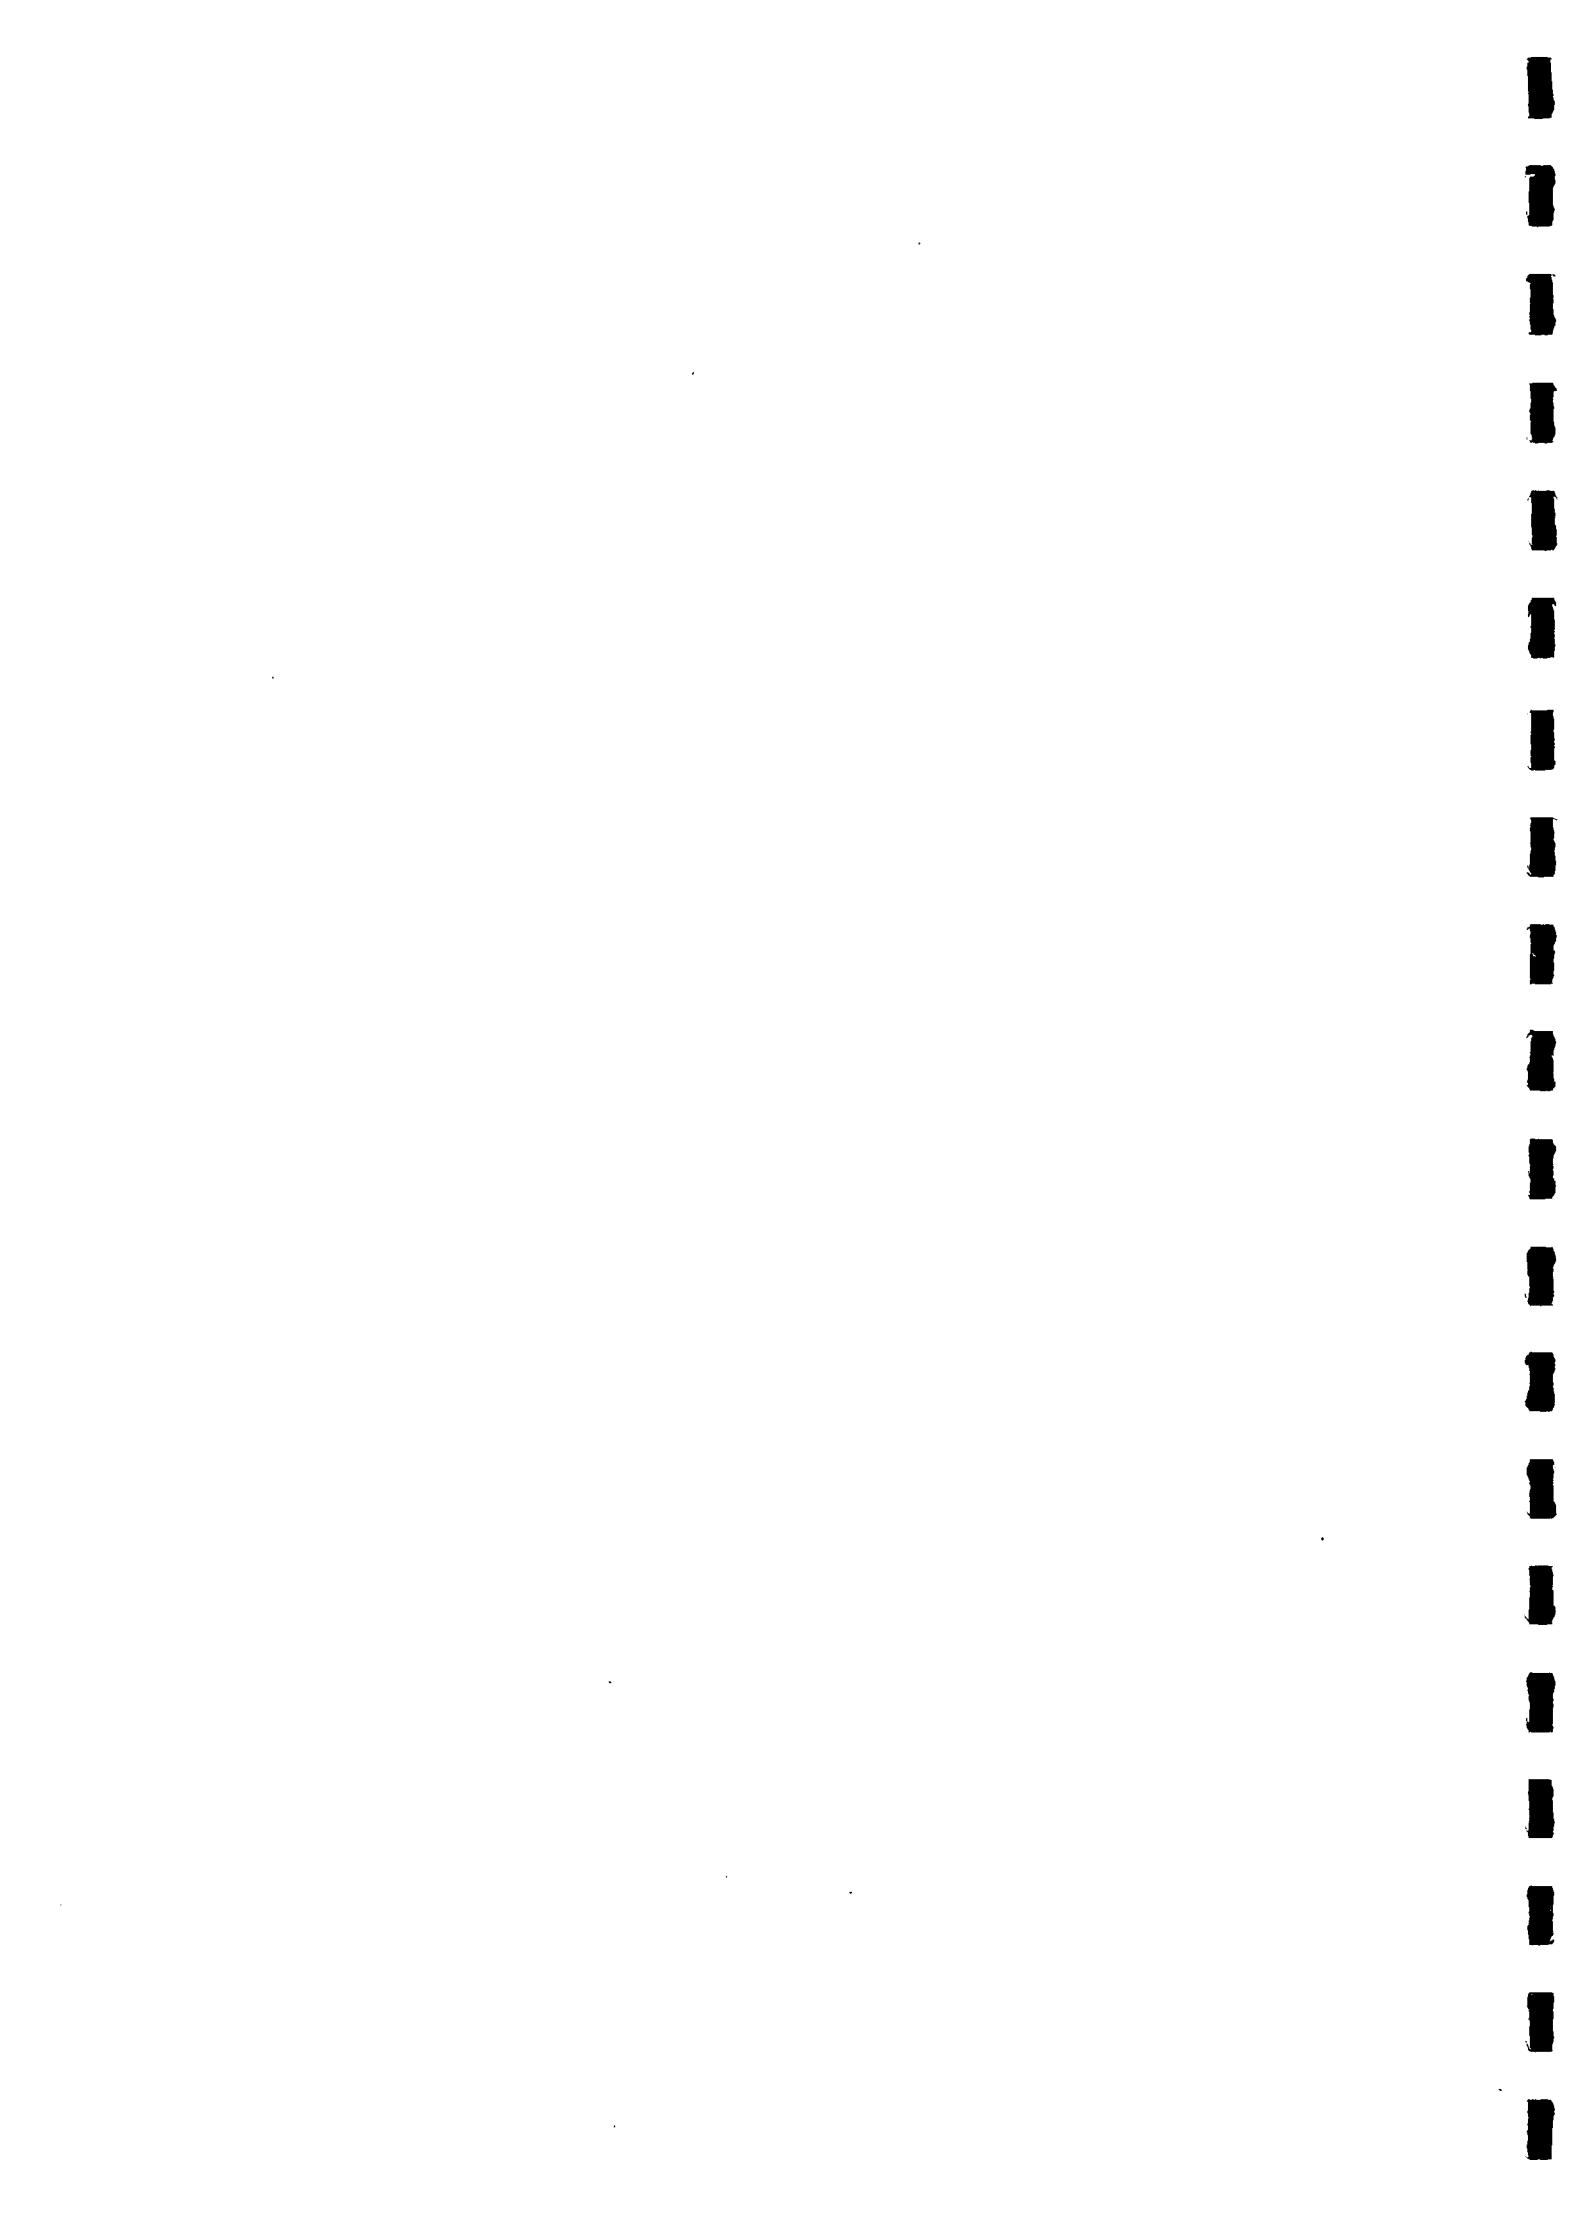

Acknowledgements

We acknowledge with thanks the assistance of Miss S. Oldfield in extracting many of the more recent references, and in compiling the author index. The members of the Mires Research Group assisted with the preparation of the original draft, and we are especially indebted to the comments and additional references supplied by H.J.B. Birks, R.E. Daniels, P.D. Moore, K.S. Simpkins, F.M. Slater and B.D. Wheeler. We are indebted to Miss S. Evans for her meticulous checking of the final manuscript.

This project was initiated when both authors were members of the former Nature Conservancy and was continued with the Nature Conservancy Council and the Institute of Terrestrial Ecology.
