DOCUMENT DATA SHEET

AUTHOR	SAUNDERS, P.M. & GOULD, W.J.	PUBLICATION DATE	1988
TITLE	CTD data from RRS <i>Challenger</i> Cruise 15/87 around the Faroe Islands.		
REFERENCE	Institute of Oceanographic Sciences Deacon Laboratory, Report, No.256, 79pp.		
ABSTRACT	<p>This report describes CTD data in both graphical and tabular form taken aboard the RRS <i>Challenger</i> on Cruise 15/87 (9 May - 5 June 1987). Approximately 80 stations were made in 8 sections around the Faroe Islands principally in order to study the outflow of Norwegian Sea water into the northeast Atlantic. Calibration procedures are summarised and the CTD salinity data reconciled with about 380 sample values. Silicates were also measured and tables of values are presented.</p>

THE COLLECTION OF CTD DATA

The data described in this report were gathered on RRS Challenger during cruise 15 in 1987. The ship sailed from Ardrossan, Scotland on 9 May and returned there on 5 June. W.J. Gould was the principal scientist for the cruise and the objectives and programme of work have been described in Cruise Report No.197 (GOULD et al., 1987)

Approximately one half of the cruise was occupied with a SeaSoar survey (towed undulating fish containing a CTD instrument) of the Iceland-Faroe Front: the results have been presented in a data report (GOULD, READ & SMITHERS, 1987) which is companion to the present volume. Lowered CTD stations were also made on the cruise: 88 are reported here. The majority of the stations were occupied in sections with a spacing of 5 to 20 km only (see Figure 1 for their geographical distribution). Three sections were occupied in the Faroe Shetland Channel, three in the Faroe Bank Channel and one just NW of its exit. Two sections (supplemented by XBTs) were occupied on the Wyville-Thomson Ridge together with a group of stations in a valley SW of the same ridge. A section was also made north from the Faroe Islands into the Norwegian Basin and a group of stations made on the Hebridean Shelf in support of a deployment of a benthic thermistor chain (Prof S.A. Thorpe, University of Southampton).

Most of the sections were designed to measure the outflow of Norwegian Sea water into the Iceland Basin. For this purpose we anticipate that the data from the Acoustic Doppler Current Profiler (RD Instruments) installed aboard the Challenger will prove invaluable.

The CTD stations were made with a NBIS instrument, 1 m path transmissometer from Sea Tech Inc., and a General Oceanics Multisampler in a side-by-side location. A general review of our procedures is found in Saunders (1985). Table 1 gives details of the measurements and of their locations.

THE CALIBRATION OF THE CTD AND RECONCILIATION WITH MULTISAMPLER DATA

The procedures adopted on Challenger 15/87 are essentially the same as described in previous IOS data reports: they are summarised here.

(a) Pressure

The calibration equation based on laboratory measurements was taken to be:

$$p = 0.1 \text{ praw} - 7.0$$

No attempts were made to test these estimates with reversing thermometers on this cruise. A small systematic underestimate of pressure at depth arises from the temperature sensitivity of the strain gauge sensor. Since its magnitude, 3.5 db for 10°C change, is small no correction has been made.

(b) Temperature

The calibration based on post-cruise calibration was:-

$$T = .00049953 \text{ Traw} + .026$$

This has remained virtually unchanged since our acquisition of the platinum resistance sensor in 1983: thus only a few comparisons were made with reversing thermometers (Table 2).

(c) Salinity

Salinity is not calibrated in the laboratory at IOS: hence we carry forward the cell factor from cruise to cruise. A value of .99971 was adopted to calculate salinity on-board ship. Approximately 380 samples of salinity were analysed on the ship using a Guildline Bench Salinometer, standardised against IAPSO Standard Seawater (batch P105, K15 = 0.99988). These revealed that the nominal salinity of the CTD needed to be corrected by between .009 and .015 during the cruise. The correction derived from the measurements made on the upcasts of 58 of the stations (when stopped) are plotted in figure 2. Interpolation was used for stations on which no salinity samples were drawn. The corrected lists of salinity were compared against the individual samples with the results shown in table 2: they are amongst the best reported by us to date.

(d) Oxygen

Because of a defective sensor and lack of spare no measurements were made of oxygen.

(e) Transmittance

Potential transmittance measurements were computed according to the algorithm of SAUNDERS & MANNING (1984). See also SAUNDERS & COOPER (1987) for further details.

(f) Silicates

A continuous flow analysis system, manufactured by Chemlab Ltd., was set up to determine silicate concentration. The output from the colorimeter was sent to a chart recorder and the peaks read automatically employing a Commodore PET microcomputer. Sensitivity was adjusted to yield 2/3 full scale deflection for a concentration of about 15 $\mu\text{mol/l}$. Calibration was provided employing 4 standardised solutions of sodium fluoro-silicate. The accuracy of the measurements is probably $\pm 0.3 \mu\text{mol/l}$.

A complete list of all the silicate measurements is found in the three pages at the end of this report. The 50 ml samples were drawn immediately on recovery of the multisampler from a station just prior to the salinity samples. The lists include silicate concentrations, sample salinity values and pressure and temperature read from the corrected CTD lists. On this cruise 380 silicate samples were measured.

COMPUTER PROCESSING OF CTD DATA

Data processing ashore started with the one-second average values obtained from the shipborne PDP11/34 system: calibrated p, T, and S (nominal) data and raw transmittance data were input. PEXEC programming developed by R.T. Pollard was employed on the GEC 4190 Computer at Wormley. The processing path is broadly described in Table 3.

It is noteworthy that the provisional salinity data required somewhat more editing than we had become accustomed to. Very sharp temperature gradients occurred on a number of stations, especially stations 62 and 63, where falls of 5°C occurred within 10 m. In these sharp and prolonged gradient regions salinity spikes appeared despite the algorithms developed to take account of the different time constants of the temperature and conductivity sensors (SAUNDERS, 1985). These spikes were removed by the median sorting technique described by POLLARD

(1985) and linear interpolations made. A very small number of poor values survived but were picked off when temperature-salinity (T-S) plots were made.

Because of the constraints of space we decided to leave out plots of the depth profiles of temperature salinity and potential transmittance. Instead T-S plots are presented grouping the data in the various sections (again see figure 1). Along with each section T-S plot there is presented a hand contoured plot of potential temperature; we expect to comment on these figures in later publications but the cold overflow water can be clearly traced in the Faroe-Shetland Channel, over the Wyville-Thomson Ridge, through the Faroe Bank Channel and on to the Iceland-Faroe Ridge.

Lists of the 88 stations occupy the main body of the report. The lists were formatted on the GEC 4190 then electronically mailed to the IBM 4381 at the Institute of Hydrology, Wallingford where they were printed off on the 4250 Electro Erosion printer. Derived quantities have been computed from the algorithms published in the UNESCO Technical Paper on Marine Science No.44 (FOFONOFF & MILLARD, 1983). Some reservation must be expressed concerning the last column of tabulated figures, the Brunt-Vaisala frequency. In these lists the values are computed from successive 5 db averages. In the past our practice was to employ 10-200 db property differences which led to much smoother distributions. However, smooth values can be constructed from these lists by differencing the (appropriate) potential density.

ACKNOWLEDGEMENTS

The authors are grateful to Messrs J. Moorey (salinity), J. Smithers (CTD) and Miss J. Read (CTD logging) and Dr D. Smythe-Wright (silicates) for their considerable assistance at sea.

The work at sea was partially funded by UK Mod(N) as part of the Joint Research Council/Ministry of Defence Research Grants agreement.

Salinity	0-2000db	+.0002	±.0024	380

Table 3
Data Processing Path

1. Input provisionally calibrated data: make Versatec plot
2. Compute potential transmittance
3. Sort data on pressure and remove spikes using median value routine
4. Interpolate missing data and replot for quality control
5. Create 5 db average, insert missing values, correct header
6. Archive 5 db average data to tape in GF3 format (CTDC15)
7. Create new variables and construct list at standard levels.
8. Print off lists and make T-S plots for report.
