## 1 INTRODUCTION

Fifteen months of data were gathered in the southern North Sea as part of the North Sea Project, a NERC Community Research Project. Each month the RRS Challenger ship time was split between a two week survey and a two week process cruise.

This report describes the results from a current meter mooring at  $53^{\circ} 30' \text{N}$   $03^{\circ} 00' \text{E}$  deployed during the survey cruises. The mooring was first deployed on survey cruise Challenger C33/88 and subsequently re-deployed during follow up cruises between August 1988 and September 1989.

Figure 1 shows the position of the mooring, site D, and its relative position to other sites in the North Sea. It was one of six current meter moorings deployed during the North Sea Survey, and was situated in a region of moderate tidal currents, up to a maximum of  $1.0 \text{ m s}^{-1}$ , and in 30m depth of water. Data reports for the other sites are given in POL reports 11, 12 ,13 (Knight, Falconer and Howarth, 1990) and 15, 16 (Knight, Howarth and Flatt, 1991).

The mooring, Figure 2, contained two instruments, an Acoustic Doppler Current Profiler (ADCP) and an Aanderaa, RCM 4 or RCM 7 current meter, both mounted on the sea bed. The ADCP recorded vector averaged North and East components of current at set levels throughout the water column. The Aanderaa measured conductivity, pressure and temperature. The pressure sensor, not of tide gauge quality, gave an indication of mooring stability.

Gaps of the order of 20 minutes occurred in the ADCP data during C35/88, C39/88, C41/88, C45/89 and C49/89 deployments. After calibration of the data and, if required, linear interpolation of the gaps, statistics were calculated and a low pass filter was applied to produce six hourly values which were also statistically analysed. Finally standard current meter plots were produced in order to check data quality and to aid in interpretation of the data.

The reference direction was estimated for each deployment, see Section 7, since the compasses returned arbitrary zero directions, because of a design fault. During C47/89 and C53/89 cruises RCM's were not fitted due to their unavailability. Also, C43/88 mooring was not deployed due to bad weather conditions. The ADCP's returned 64% (angle corrected) and the RCM's 100% good data when deployed. The data coverage over the 15 month period was 59% for the ADCP's and 82% for the RCM's.

## 2 SUMMARY OF DEPLOYMENTS

The following information gives an overview of the data processed at site D during the North Sea project.

<b>Mooring</b>	<b>Meter</b>	<b>Deployment</b>	<b>Recovery</b>	<b>Meter</b>	<b>Data length</b>	<b>Comments</b>

### **3 RIG SYSTEM DESCRIPTION**

The mooring was deployed in a water depth of 30m at latitude 53° 30'N and longitude 03° 00'E. It consisted of two instruments, see Figure 4, and an IOS acoustic release mounted on a frame positioned on the sea bed. On recovery the release was triggered by sending acoustic signals from the ship so that the frame separated from the ballast weight. The frame under its own buoyancy (glass spheres) then rose to the surface ready for picking up. Figure 2 shows a schematic diagram of the mooring.

### **4 CURRENT METER SPECIFICATIONS**

The ADCP (Proudman Oceanographic Laboratory 250 KHz version) measured the vertical profile of currents in bins from the sea floor to the surface. The Aanderaa of type RCM 4 or RCM 7 was used to measured conductivity, temperature and pressure.

#### **4.1 Acoustic Doppler Current Profiler (POL 250 KHz version)**

The ADCP sends out short acoustic pulses, typically lasting a few thousandths of a second, at a fixed frequency. The acoustic pulses are transmitted in two narrow beams at right angles to each other and 30° to the vertical and are reflected back to the ADCP by small particles such as plankton which move with the water. The frequency of the reflected signal is changed by a small amount proportional to the current speed, the Doppler shift. By measuring the frequency change along the two beams the speed and direction of the currents are determined. The currents at different heights through the water column are obtained by chopping the return signal into segments by time.

The 250 KHz ADCP has a range of 100m and can measure up to 24 bins. However, the technique has some limitations which reduce the amount of good data return. The closest bins to the transducers can give erroneous data due to the time taken for transients to decay and the far end bins can be effected by interference from side lobes reflected from the sea surface. Hence, the good data return bins are usually between 25% of depth from the surface and 10% of depth from the bottom. The good bin returns are as follows : C35DC / C37DC / C41DC / C45DC / C47DC / C49DC / C51DC / C53DC / C55DC / C57DC / C59DC / bins(1-5) with bins 1 (bottom) to 8 (top). The M2 amplitude generally increases with each bin up through the profile. However, amplitudes for bin 5's tended to be significantly lower than for bin 4's. Also, deployments C47DC, C49DC, C53DC, C57DC and C59DC show larger than expected vector mean speeds. Both of these anomalies are currently being investigated.

#### 4.2 ADCP specification

<b>Speed</b>	Range      0 to 350 cm s <sup>-1</sup>
	Accuracy $\pm 4$ cm s <sup>-1</sup>
<b>Direction</b>	Refer to section <b>7 ANGLE CORRECTION TO ADCP DATA</b>
<b>Tilt</b>	Two tilts measured at 90° to each other (not used in processing)

#### 4.3 ADCP set up details

<b>Set up</b>	Sample period	10 minutes
	Number of bins (cells)	8
	Number of pings in ensemble	425
	First bin height/Bin separation	7.9 m / 4.5 m
	Bin heights (range) (1-8)	7.9 m / 12.4 m / 16.9 m / 21.4 m / 25.9 m / 30.4 m / 34.9 m / 39.4 m

#### 4.4 Aanderaa RCM 4 and RCM 7 current meters

Temperature is measured by a thermistor fitted into a stud extending into the water. Conductivity is measured by an electrodeless induction conductivity cell and pressure is measured by a sensor consisting of a potentiometer driven by a Bourdon tube. Both types of meter used similar sensors, but differed in data storage. The RCM 4 used 6mm width reel magnetic tape and the RCM 7 used solid state memory.

#### 4.5 Aanderaa sensor specifications

<b>Temperature</b>	Range      -2.46 to 21.4°C
	Accuracy $\pm 0.05^\circ\text{C}$
<b>Conductivity</b>	Range      21 to 51 mmho cm <sup>-1</sup>
	Accuracy $\pm 0.025$ mmho cm <sup>-1</sup>
<b>Pressure</b>	Range      0 to 100 PSI or 0 to 200 PSI
	Accuracy $\pm 1\%$

## 5 DATA PROCESSING STEPS

### 5.1 Raw data transfer

The data from the deployments were brought back to POL in three different forms. These consisted of standard magnetic cassette from the ADCP, 6mm width magnetic tape from the RCM 4 and 3.5 inch floppy disk from the RCM 7. The RCM 7 data was translated from the solid state memory on board ship and the RCM 4 and ADCP data were translated on to an IBM/PS2 at POL. The data were then transferred to the IBM 4381 mainframe via a 3270 terminal emulator on the IBM/PS2.

### 5.2 Processing stage

Two software systems, CALT and CALP, were developed at POL for quick and efficient processing and display of times series data, such as current meter data. The CALT system calibrates and checks for errors and the CALP system produces standard graphical output, filtered and non-filtered statistical analyses. Before calibrating the data, all the information required for processing were input into an ORACLE data base. All the information could then be accessed easily with FORTRAN programs.

Processing was then initiated by CALTUX, which calls a suite of FORTRAN programs for error checking and producing calibrated data. Any errors found from the initial run were edited out of the raw data and CALTUX run again. After successful completion of the CALTUX stage another suite of FORTRAN programs initiated by DOPTX were used to produce the output contained in this report. The types of plot obtained, details of filtering and statistics are explained in more detail in the following sections.

### 5.3 Interpolation

In some data sets, gaps occur of the order of 20 minutes, as indicated by the meter information sheets found further into the report and in section 2 SUMMARY OF DEPLOYMENTS. In these cases the gaps were filled by linear interpolation to the data before producing standard graphical output and statistical analyses.

## 6 DETAILS OF STATISTICS AND FILTERING

### 6.1 Simple statistics

A simple statistical analysis was carried out on each calibrated data set. The following statistics were calculated :-

- (1) Mean, variance and standard deviation of the East and North components of velocity.
- (2) The mean vector speed and direction were calculated from the above statistics.
- (3) The maximum ten and minimum ten Northings and Eastings and the top speeds.

### 6.2 Variance ellipse statistics

Statistical analysis was also carried out on the ellipse which can be graphically represented by a scatter plot. The following statistics were calculated :-

- (1) The maximum and minimum variances and their ratio (minimum/maximum). If the ratio is near to one the currents have no preferred direction, whilst if it is near to zero the flow is rectilinear.
- (2) The direction associated with the maximum and minimum variance, in the range of  $-180^\circ$  to  $+180^\circ$ .
- (3) The total variance which equals the sum of the North and East component variances or the sum of the maximum and minimum variances.
- (4) The average direction for each half of the ellipse, related to the directions of maximum variance. If these directions differ by  $180^\circ$  the scatter plot is symmetrical.

### 6.3 Filtering

The ten minute calibrated data were also low pass filtered, see Figure 3 which shows the filters response function, and sub-sampled every 6 hours. Three days of data are lost at the beginning and the end of the record. The statistical analysis was repeated on the filtered data set.

## 7 ANGLE CORRECTION TO ADCP DATA

### 7.1 Direction measurement

Figure 5 shows how beam 1 and beam 2 of the ADCP align with respect to the frame and the compass. The compass manufactured by Digicourse (no longer in production) measures the angle between magnetic North and the frame. The two beams can be converted into East and North components of velocity by using the angle obtained from the compass and trigonometry.

Preliminary analysis of ADCP data obtained from the Celtic Sea showed no problem with this type of compass. However, during the North Sea Project it had a tendency to stick giving directions of flow different from those predicted by tidal model results (Proctor, personal communication) and previous current meter records (Howarth, 1990). Also, the frame moved on the sea floor during some storm events. A correction was then required to the frame angle for each deployment.

### 7.2 Correction procedure

The ADCP data were first processed using the CALT and CALP software. The statistical analysis gave the angle  $\alpha$  of maximum variance as shown in Figure 6(a). This angle  $\alpha$  was taken to represent the M2 major axis tidal ellipse angle  $\beta$  shown in Figure 6(b). The compass, although giving incorrect readings of frame angle was recording direction to an unknown fixed position. It was therefore decided to correct the frame angle by adding a correction angle.

The correction angle was calculated from the difference between  $\beta$  calculated from a model and  $\alpha$  calculated from the initial raw data analysis. The model gave a depth average value so  $\alpha$  obtained from the data bin closest to this depth was needed. The bin to use was found by taking the bin nearest to a value  $z=0.4D$ , where  $D$  is the total depth of water and  $z$  is the height from the bottom (Prandle, 1982). There is a  $180^\circ$  ambiguity in the calculation of  $\alpha$  which was resolved by study of the M2 tidal phase given by the model and by the observations.

### **7.3 Adaption of correction for frame movements**

During some of the deployments the tilt and compass measurements from the ADCP and recovery positions of the mooring indicated limited movement of the frame on the sea floor. On some occasions the compass reacts correctly to the movement and the correction procedure is as in section 7.2. However, when the compass does not react correctly to these changes the record has to be split up into stable periods and the procedure in section 7.2 followed.

## 8 FORMAT OF DATA OUTPUT

All speeds and velocities are in m/s, directions in degrees true and time in GMT. The results are ordered by mooring number (See page 10). Each mooring result is made up of mooring information, meter information and, combined and depth averaged graphical output and statistics (unfiltered and filtered) with the ADCP first followed by the RCM.

### 8.1 Mooring information

Position latitude	: Latitude of deployment
Position longitude	: Longitude of deployment
Water depth(m)	: Depth measured from ship's echo sounder
Deployed on cruise	: Cruise identifier
Recovered on cruise	: Cruise identifier
Site name identification	: Additional site identifier
Magnetic deviation	: Taken from charts
Rig deployed on	: Time frame on the bottom
Rig recovered on	: Time release fired on rig
Period of deployment	: Total time of deployment
Comments	: Details regarding mooring

### 8.2 Meter information

Rig number	: Unique POL mooring/rig reference
Meter number	: Four digit current meter number
Frame angle correction	: Correction to be added to ADCP frame angle
Sample interval	: Sampling interval in seconds
Meter height from bottom	: Height in metres
Position of meter on rig	: A for attached to frame
Meter type	: DP for ADCP AA for RCM 4 AS for RCM 7
Meter started	: Date and time
Meter stopped	: Date and time
Time of last valid scan	: Used when good data ends before switch off
Period in days on record	: Total time meter switched on
Total number of scans	: Used to check timing
Timing error	: Error in seconds
Comments	: Details regarding meter

### **8.3 Combined ADCP profile output**

- (1) North and East components of velocity against time. The semi-diurnal nature of the tides can be seen as well as the Spring/Neap cycle in both components of velocity.
- (2) Scatter diagrams of North components of velocity against the East components. Shows the direction and magnitudes of the currents. This plot is often a good check on the quality of the data, in particular regarding direction and possible problems at low speeds.
- (3) Stacked filtered stick plot. The filtered data can be displayed in a stick type way in order to see the change of the residual flow with time and through the vertical.
- (4) Combined statistics for each bin giving vector mean speed and direction, and maximum and minimum variance and directions of maximum and minimum variance.

### **8.4 Single bin (closest to depth average) output**

- (1) North and East components of velocity against time.
- (2) Eulerian progressive vector plot. The nature of the residual flow is emphasised, although the semi-diurnal tides are also apparent.
- (3) This is followed by simple statistics of the calibrated data and filtered data. The filtered statistics page is indicated by the letter 'F' at the end of the file type printed at the top of the page. The statistics shown are from the ADCP bin closest to a value representing the depth averaged value.

### **8.5 Aanderaa graphical output**

- (1) Temperature, salinity and pressure against time. Salinity is calculated from temperature, conductivity and pressure.

## ACKNOWLEDGEMENTS

The authors would like to thank POL engineers for setting up, deploying and recovering the instruments. The survey on such a large scale and with quick turn around of equipment needed would not have yielded such excellent returns without their effort and it is to their credit. We would also like to thank Steve Loch of BODC for undertaking the initial design and implementation of the CALTUX software.

## Rig information details for C39DC

Position	Latitude	:	53 29.81N
Position	Longitude	:	02 59.92E
Water depth		:	31.0 m
Deployed on cruise		:	C39
Recovered on cruise		:	C41
Site name identification		:	D
Magnetic deviation		:	3.7 degrees west
Rig deployed on		:	04-NOV-88 15:30:00
Rig recovered on		:	12-DEC-88 13:30:00
Period of deployment		:	37.9 days
Comments		:	Frame moves during deployment

**Meter information details for 0004**

Rig No : C39DC  
 Meter No : 0004  
 Recording interval : 600.0 seconds  
 Meter height from bottom : 0.8 m  
 Meter type : DP  
 Meter started : 04-NOV-88 11:09:27  
 Time of last valid scan : 12-DEC-88 07:49:15  
 Period of good data : 37.3 days short record  
 Total number of scans : 5378  
 Timing error : 12 seconds fast  
 Comments : Compass does not react correctly to frame movement

Applied frame angle corrections are  
 209.0 degrees between scans 1 - 1987  
 213.4 degrees between scans 2049 - 3405  
 227.9 degrees between scans 3406 - 3577  
 200.0 degrees between scans 3578 - 4317  
 149.4 degrees between scans 4614 - 5377

Twenty-four increments of 30 minutes instead of 10 minutes every 219 scans
