## 1. Introduction

This report is the third in an annual series presenting statistical results from tide gauge sites on the modernised U.K. Class-A network interrogated with the Data Acquisition for Tidal Applications for the Remote Interrogation of Network Gauges (DATARING).

A total of 27 Class-A sites were modernised by the end of 1990 (Figure 1). Four sites modernised in 1989 are introduced in this report for 1990 :- Mumbles and Milford Haven (Hakin) in south Wales, Lerwick in Shetland and Whitby, North Yorkshire.

Other sites which were modernised during 1990 include Portpatrick in Galloway, Newhaven, Sussex and a completely new installation at Hinkley Point in Devon.

Maps showing the instrument sites and bench mark information for the seven new installations are included in this report with statistical and analytical results for 1990 for all twenty-seven where sufficient data have been obtained.

During the year, much attention was paid to the storm events of the 1989-1990 winter, and their effects on coastal areas particularly in North Wales and in the south west. To improve forecasting capabilities, sites have been very recently modernised at both Weymouth and Portsmouth on the south coast with plans in hand for more gauges in North Wales.

Extreme, mean sea level and surge diagrams and statistics from the modernised sites are included in this report.

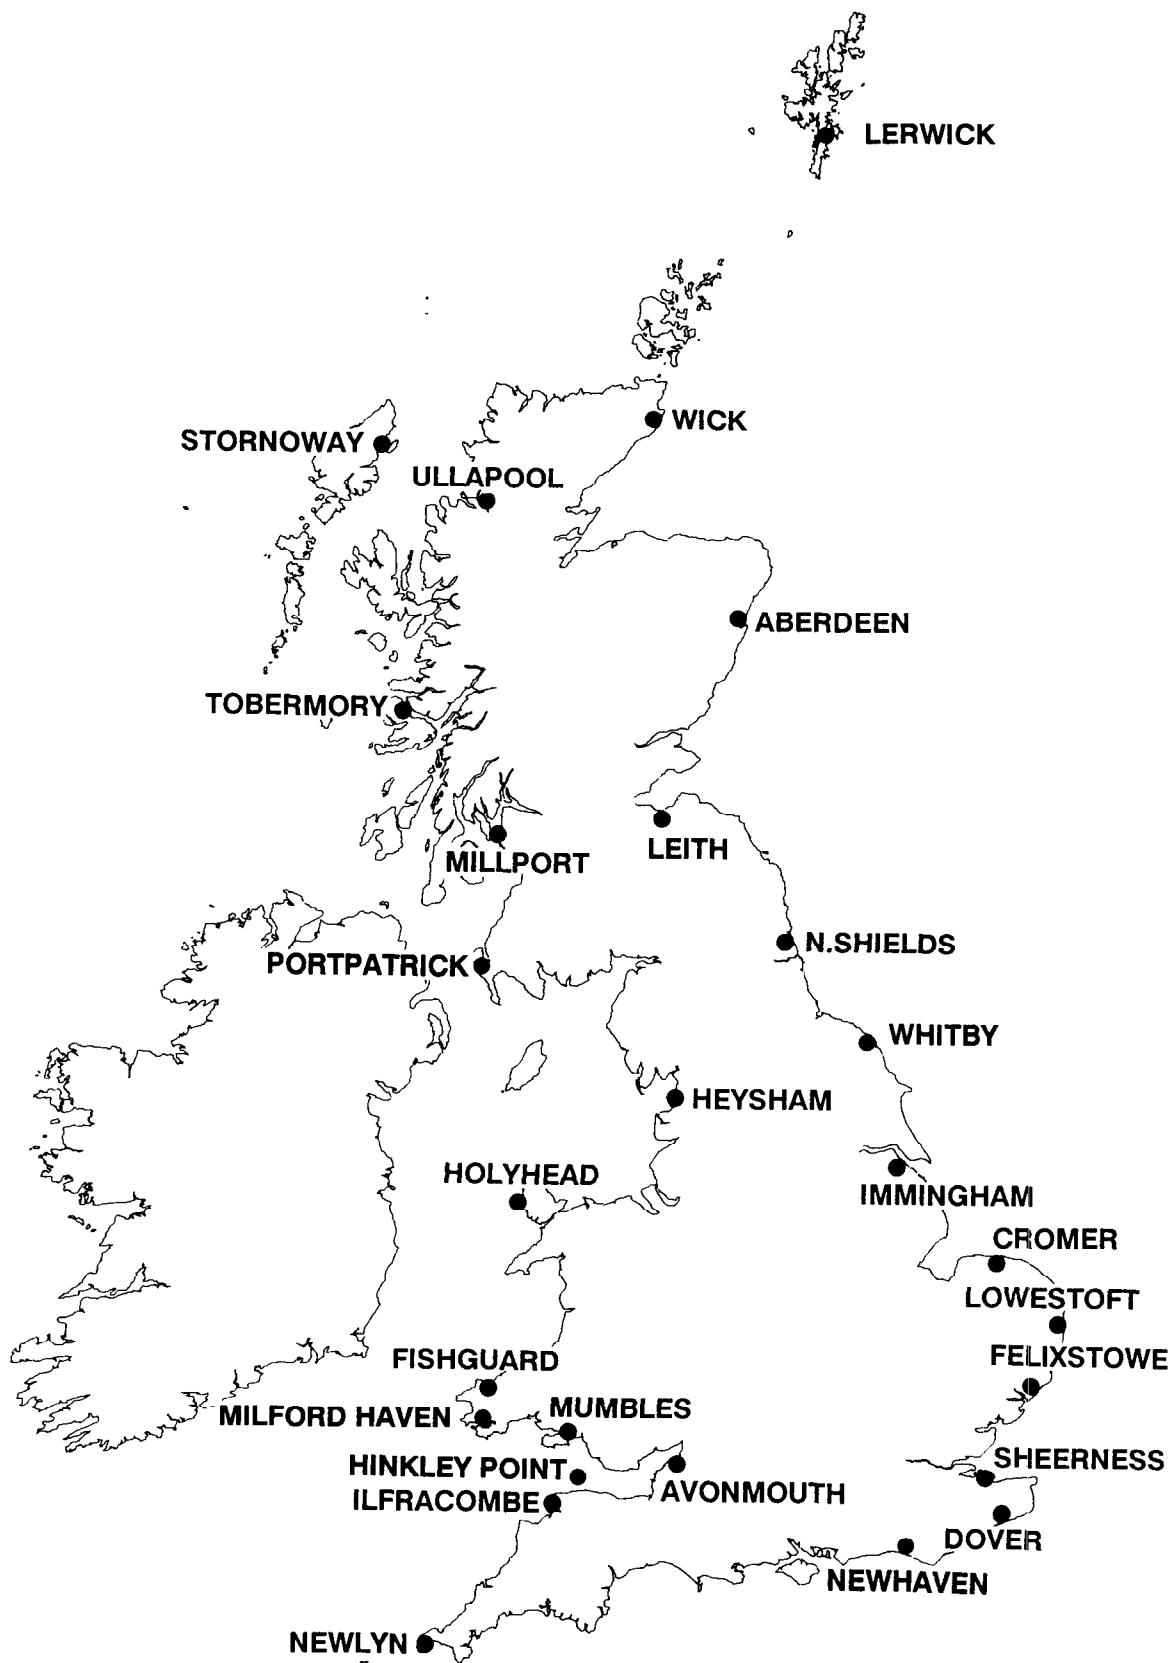

Figure 1. Class A Tide Gauge sites operational in 1990.

## 2. General description of sites and processing

All installations which have undergone modernisation are interrogated weekly from the Proudman Oceanographic Laboratory. Raw values thus collected undergo a vigorous checking and editing procedure before being filtered to hourly values at intervals of approximately a calendar month. Every effort is made to retrieve a maximum number of values from each site, and some interpolation over short periods takes place where considered to be a safe exercise in terms of accuracy.

Although all sites have a minimum of two recording 'channels' of data these are frequently from differing instruments. Elevations obtained from these, unless within a very few millimetres of one another are not mixed in the reduction process. For 'new' sites, a complete year's record from each channel is analysed before a decision is taken to adopt a 'Class-A' channel for continuing processing. The second channel of data is retained as a back-up series in its raw form.

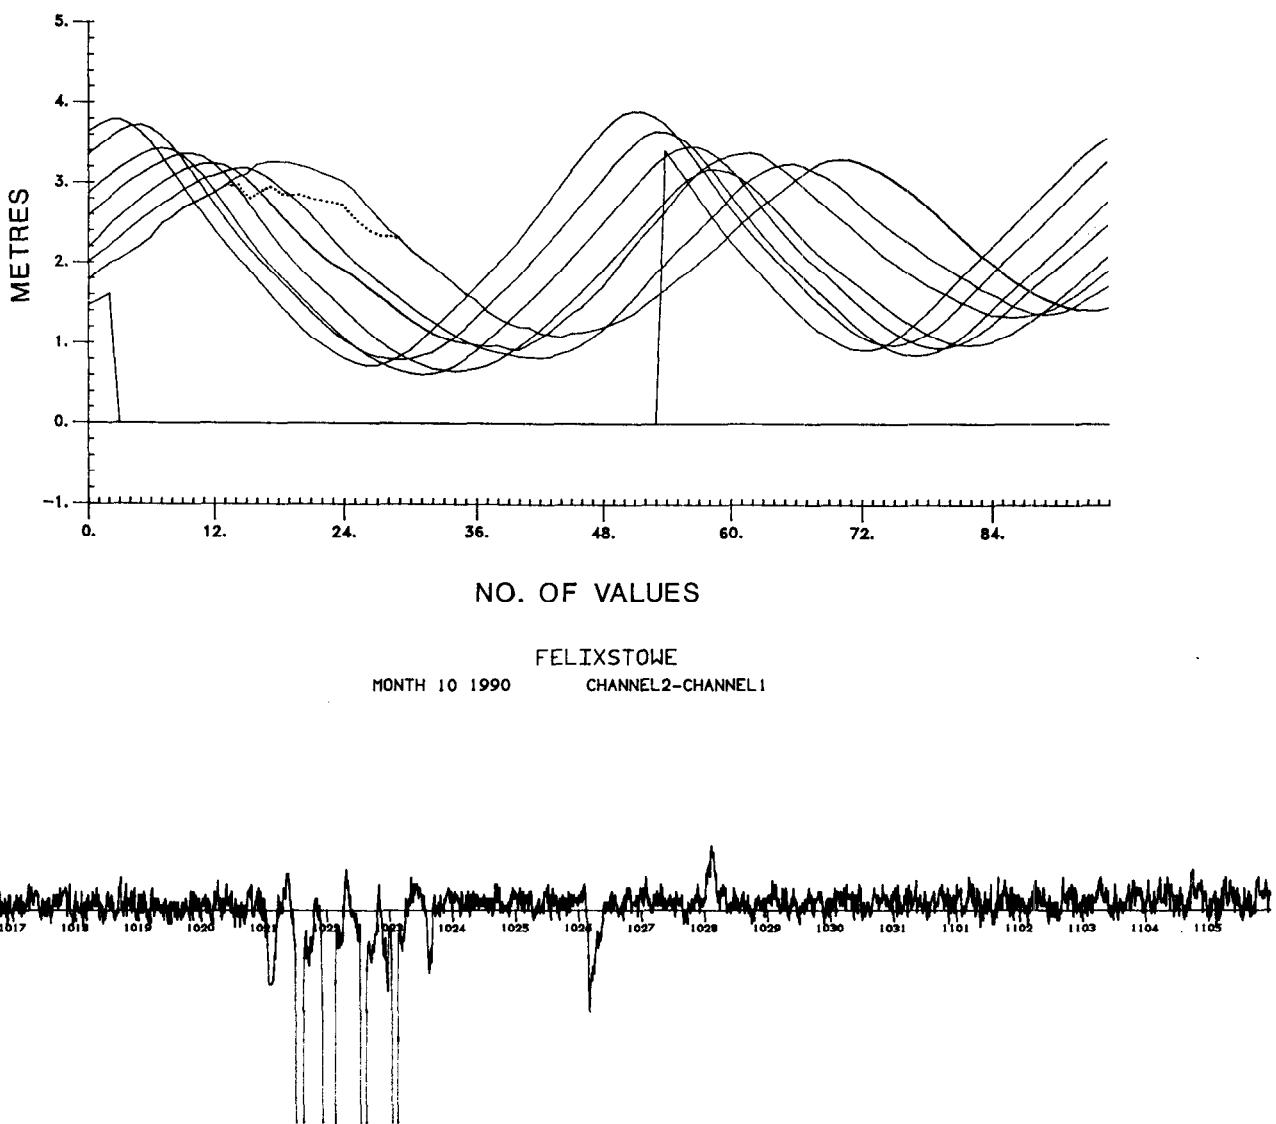

Figure 2. Typical plots of a) Raw Dataring values covering a period of a week, and b) The differences between recording channels at a site with two digiquartz sensors.

## Aberdeen

Latitude 57 deg 08' 38.9"N Longitude 02 deg 04' 43.2"W  
 National Grid reference NJ 9524 0590

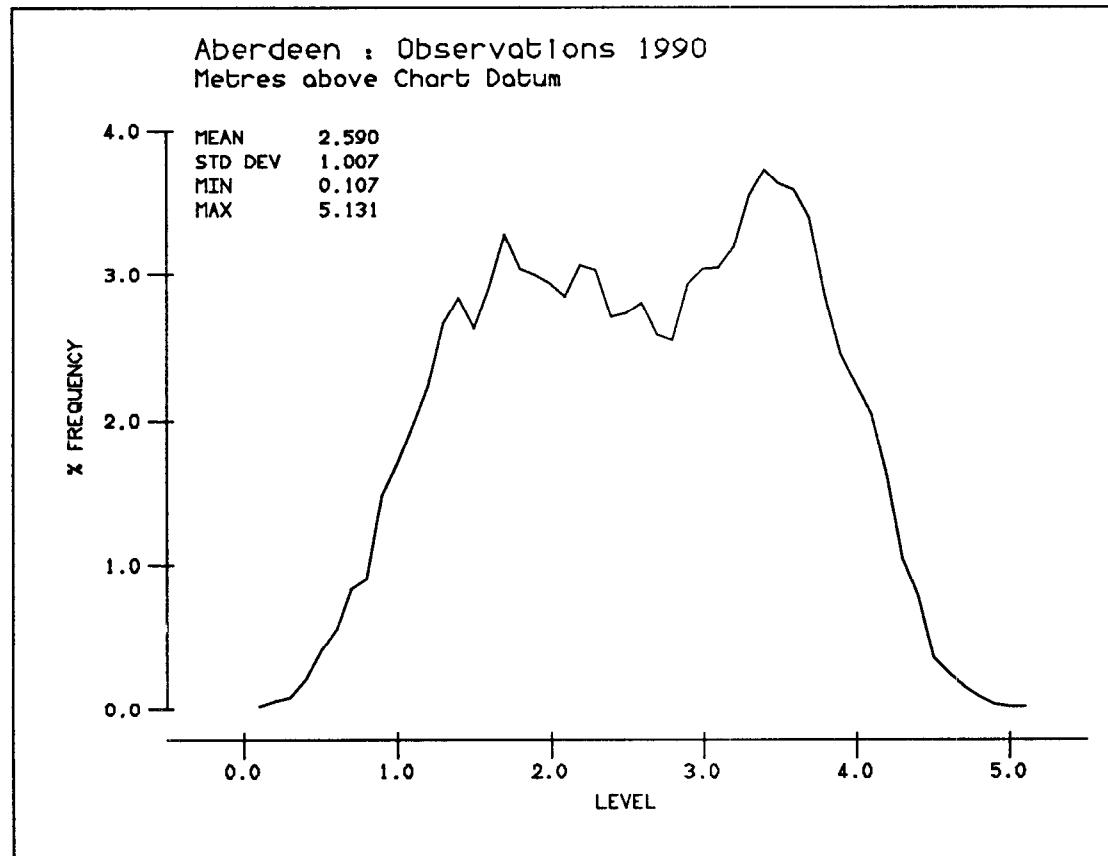

Recording zero = Chart Datum = 2.25m below Ordnance Datum Newlyn  
 Recording zero = 6.091m below Tide Gauge Bench Mark

Upgraded to Dataring in December 1985 with a potentiometer linked to the Munro gauge in the stilling well and a digiquartz sensor attached to a pressure gauge.

A complete series of hourly levels was collated from the digiquartz channel for 1990, which is the designated Class-A channel of data.

The Tide Gauge Inspectorate (TGI) visited the site 14 December. Values integrated at 1 7/8 minutes over the period were edited.

Isolated missing scans were edited on the following dates: 8 Jan; 15 Feb; 13,22 Mar; 12 Apr; 15 May; 14,26 Jun; 20 Jul; 8,31 Aug; 17,26(2) Sep; 7,23,25 Oct; 26,29 Nov.

**Avonmouth**

Latitude 51 deg 30' 36.9"N Longitude 02 deg 42' 50.7"W  
 National Grid reference ST 5045 7933

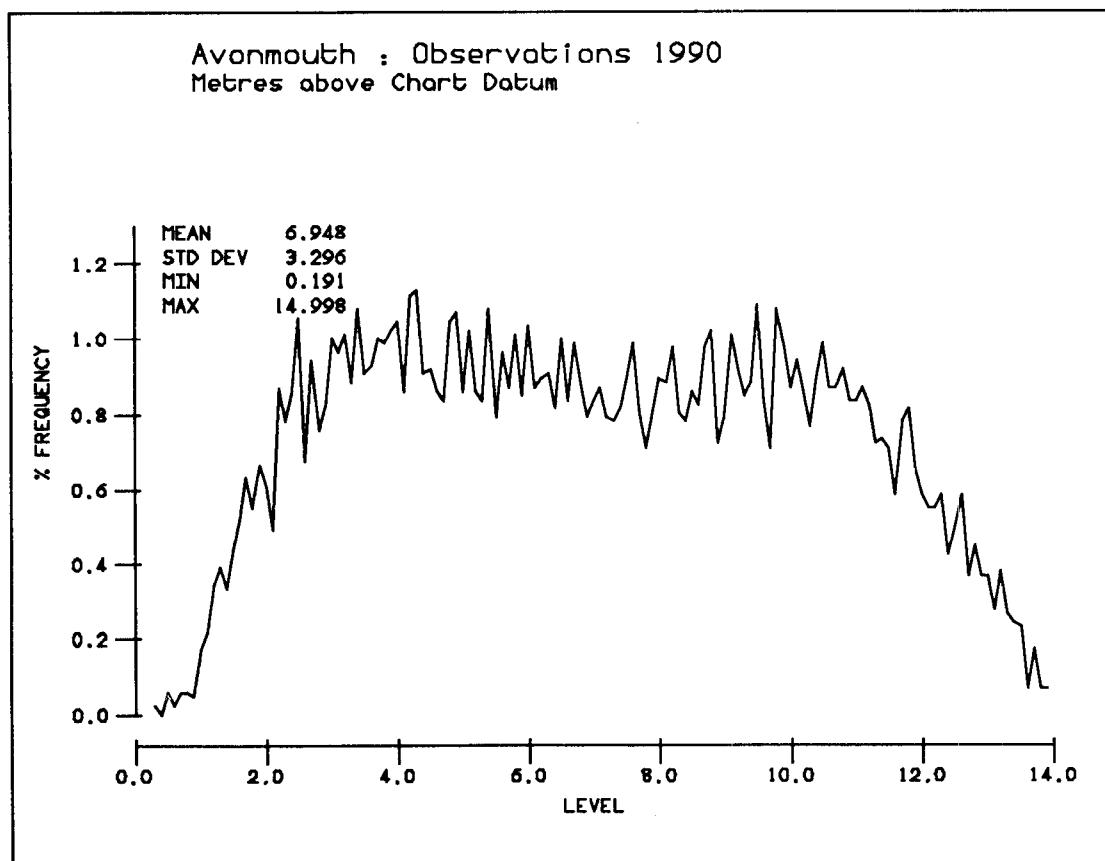

Recording zero = Chart Datum = 6.5m below Ordnance Datum Newlyn  
 Recording zero = 15.711m below Tide Gauge Bench Mark

This site was modernised in September 1986 with two digiquartz sensors attached to pressure gauge outlets. Channel 1 became the designated Class-A channel in January 1988.

A fault developed in the on-site modem creating a gap in hourly levels processed for 1990 from 00hrs GMT 3 April to 01hrs GMT 5 April.

Spurious values and missing scans were edited at the raw stage for the following dates:  
 5,20,22 Jan; 3,4,9,12,16,17 Feb; 1,4,5,6,8,14,29 Mar; 9,16,17,18 Apr; 1,18,20,28 May;

 1,24,25 Nov; 3,16,19,27(2) Dec.

The TGI visited the site 20 May.

## Cromer

Latitude 52 deg 56' 1.9"N    Longitude 01 deg 18' 12.5"E  
 National Grid reference TG 2198 4253

Recording zero = Chart Datum = 2.75m below Ordnance Datum Newlyn  
 Recording zero = 10.117m below Tide Gauge Bench Mark

Of the two recording channels both with digiquartz transducers, Channel 2 is the designated Class-A channel.

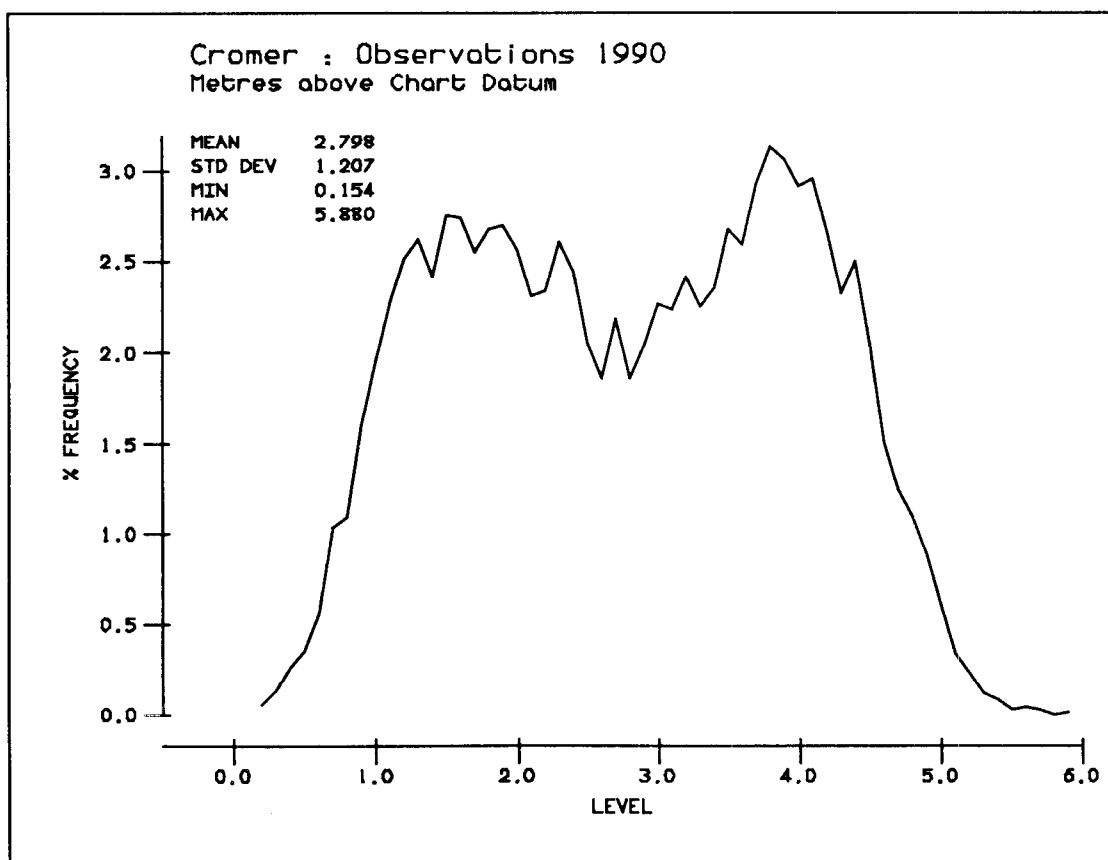

A modem failure at Cromer on 5 February was finally repaired by TGI on 2 April. Unfortunately a back-up Aanderaa tape ran out on 14 March preventing a complete retrieval of the gap in recording.

Spurious values and missing scans were edited at the raw stage for the following dates: 3 Jan; 24 Apr; 20,27 Jul; 9 Oct; 29 Nov; 10,25,28 Dec.

24 September. Routine maintenance visit by TGI. Values integrated at 1 7/8 minute were edited.

### Gaps in hourly filtered levels (Channel 2 digiquartz)

20hrs. 5 February - 23hrs. 2 April                  Modem failure.

**Dover**

Latitude 51 deg 06' 59.7"N Longitude 01 deg 19' 5.4"E  
 National Grid reference TR 3220 4055

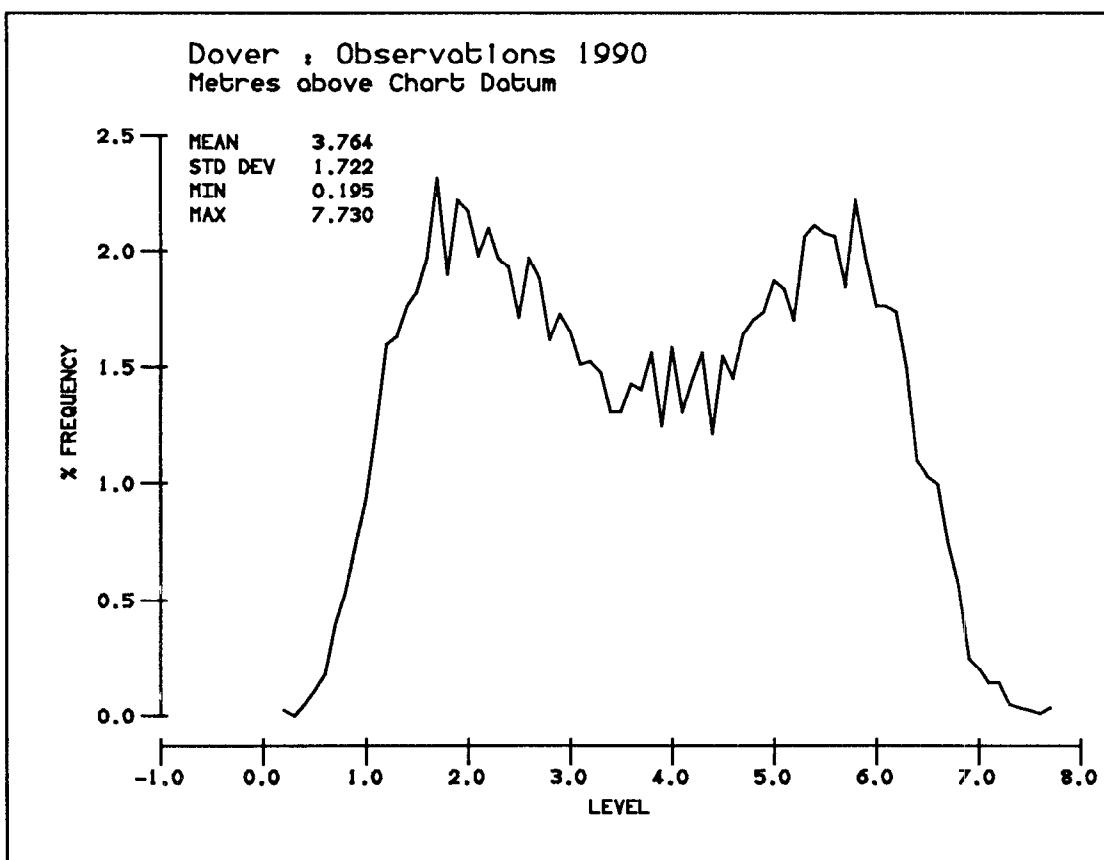

Recording zero = Chart Datum = 3.67m below Ordnance Datum Newlyn  
 Recording zero = 10.491m below Tide Gauge Bench Mark

Hourly levels were filtered from the channel 2 potentiometer attached to the Munro gauge.

The Tide Gauge Inspectorate visited the site on 5 February for routine maintenance. A memory board failure occurred on 12 November causing the TGI to revisit on 15 - 16 November and again on the 28 November when all memory boards were replaced. The period of lost hourly levels ultimately extended from 20hrs GMT 12 November to 14hrs GMT 30 November.

Spurious and missing values were interpolated at the raw stage for the following dates: 8,9,18,23 Jan; 4,5,24 Feb; 16,19,22,27 Mar; 1(3),9,21(2),25,26,28,30 Apr; 3,4,14,15,17,20,22,24 May; 19 Jun; 6,9,16(2),17,20,21,25,30 Jul; 8,13,22 Aug; 6,7,8,9,12,13(2),14(4),23,26,28 Sep; 1,4,14,15,16 Oct; 5 Nov; 27 Dec.

There were steps in the recording from mid March to April which were also edited.

## Felixstowe

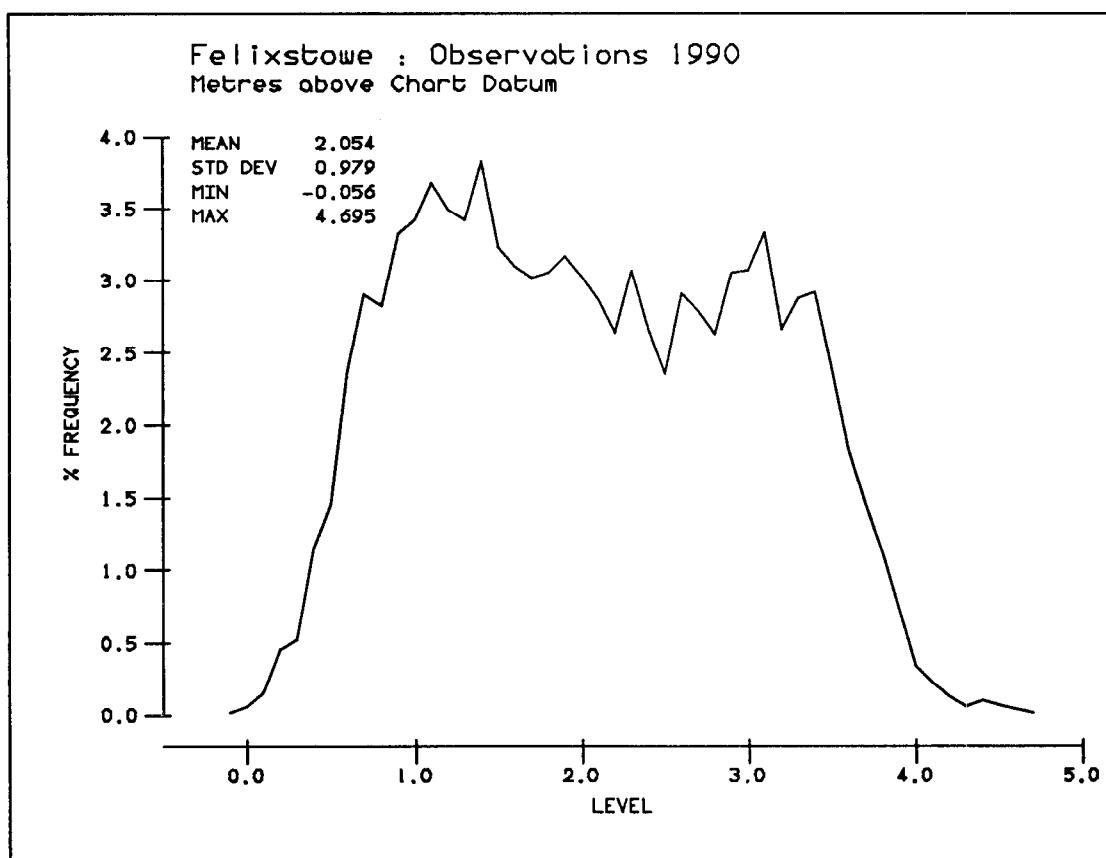

Latitude 51 deg 57' 22.8"N Longitude 01 deg 21' 0.0"E  
 National Grid reference TM 3015 3400

Recording zero = Chart Datum = 1.95m below Ordnance Datum Newlyn  
 Recording zero = 5.690m below Tide Gauge Bench Mark

This installation, furnished with two pressure gauge systems was modernised in September 1988.

Spurious and missing scans were interpolated at the raw stage for the following dates: 12,14 Jan; 8,13 Feb; 12 Apr; 30 May; 19,29 Jun; 3,14,29 Jul; 8 Aug; 27 Sep; 24 Dec.  
 Scans integrated at 1 7/8 minute during a maintenance visit by TGI, 26 September were also edited.

Problems thought to be caused by water in the tubing created flats over high waters on the Class-A channel 2 channel of data. There being little difference between recordings, figures from channel 1 have been substituted for the periods 21 to 23 October and 00hrs. to 1015hrs. 26 November to maintain a complete series for 1990.

## Fishguard

Latitude 52 deg 00' 46.2"N Longitude 04 deg 58' 57.5"W  
 National Grid reference SM 9534 3918

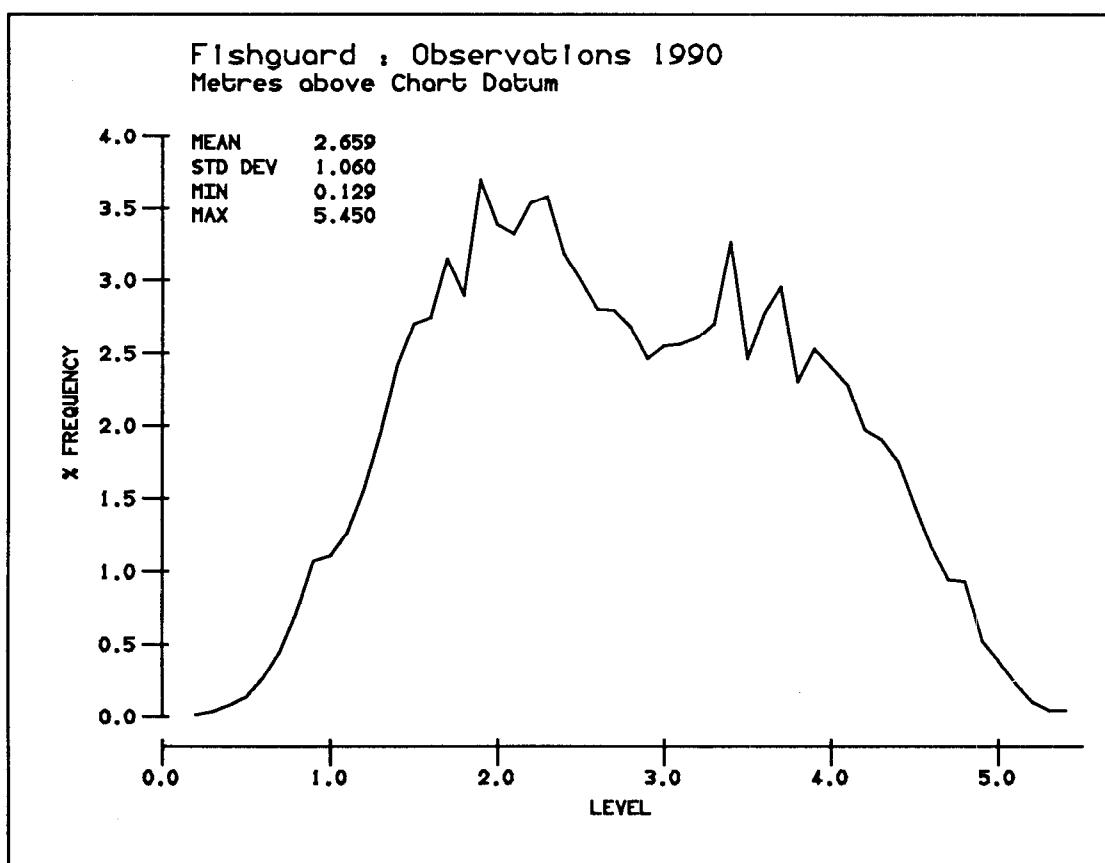

Recording zero = Chart Datum = 2.44m below Ordnance Datum Newlyn  
 Recording zero = 7.88m below Tide Gauge Bench Mark

This site was completely refurbished in June 1988 with two digiquartz sensors attached to pressure point systems. Values from the 2nd channel of data were treated as Class-A.

Spurious and missing scans were interpolated at the raw stage for the following dates:  
 8,23(2),25,26,31 Jan; 21 Feb; 5 Mar; 8 Apr; 8,11,15,24 May; 15,20 Jun; 3,6(2),22 Jul; 1,6,31 Aug; 28 Sep; 4,15(3),17,21,25 Oct; 5,19,28(2) Nov; 28 Dec.

Scans integrated at 1 7/8 minute over a TGI maintenance visit on 2 August were also edited.

There were ultimately no gaps in the 1990 filtered hourly series of levels.

## Heysham

Latitude 54 deg 02' 0.3"N Longitude 02 deg 54' 41.7"W  
 National Grid reference SD 4030 6012

Recording zero = Chart Datum = 4.90m below Ordnance Datum Newlyn  
 Recording zero = 12.095m below Tide Gauge Bench Mark

Compressor and modem problems at this site prevented any recordings of the severe surge effects accompanying the storm of 25-26 January. However, repairs were made by TGI on 13 February, in time to record the even larger storm of 26 February.

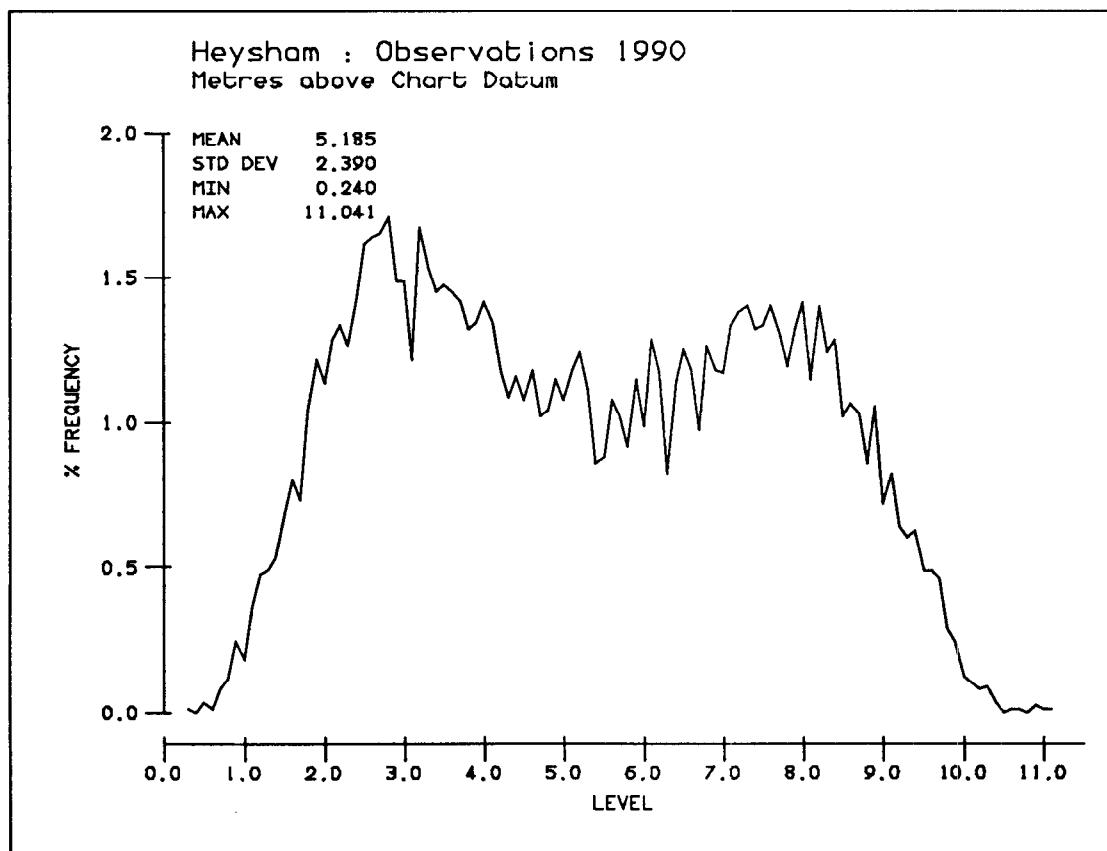

Spurious values and missing scans in the raw data were interpolated for the following dates:  
 15 Jan; 6 Feb; 14 Jun; 2,31 Aug; 11 Dec.

Scans integrated at 1 7/8 minutes during the TGI visit of 13 February were also edited at the raw stage.

### Gaps in hourly filtered levels (Channel 2 digiquartz)

00hrs 23 January - 20hrs 29 January

The TGI visited the site both on the 24 January and 13 February.

## Hinkley Point

This new site to the network of gauges became operational in March 1990 with two digiquartz pressure transducers sited underwater in vented chambers suspended from a steel pole connected to the structure of the power station cooling water intake tower some 400m offshore.(Figure 3).

Neither harmonic constants nor residual statistics for 1990 are presented as there are insufficient data for meaningful analysis. Extreme and mean sea levels have however been computed (Section 3).

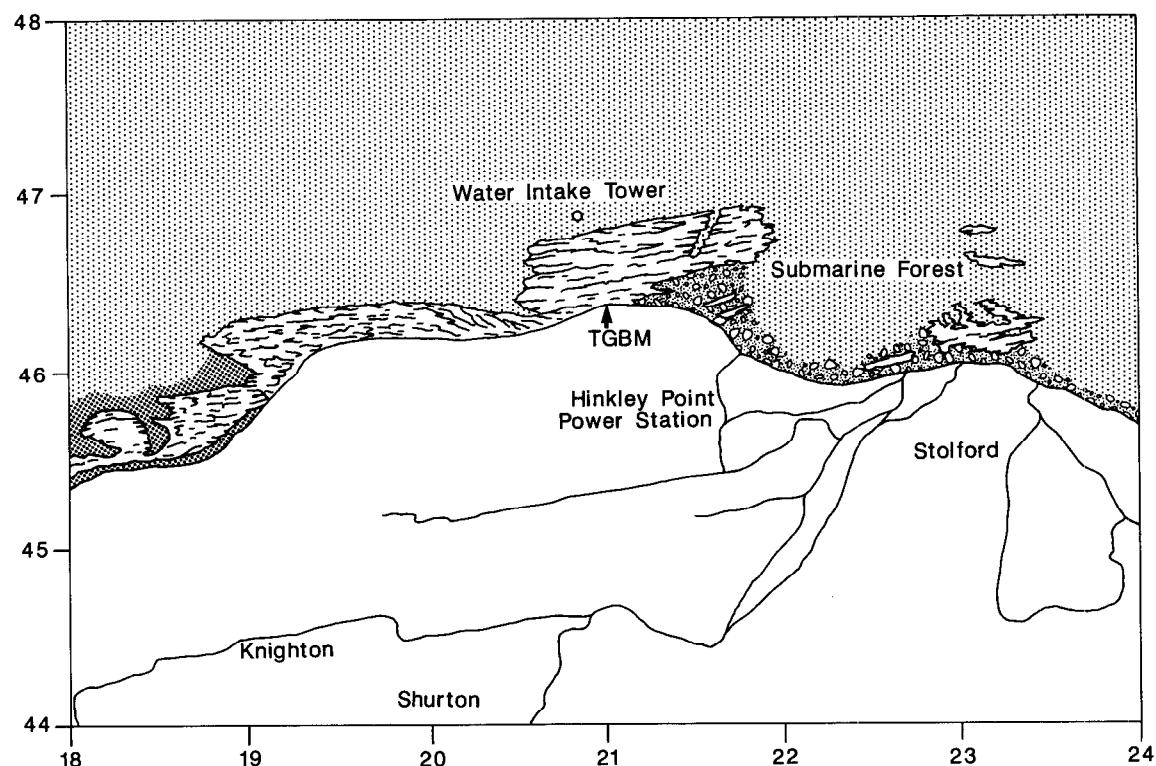

### Geographic and reference details

Latitude 51 deg 12' 54.1"N    Longitude 03 deg 07' 59.0"W

National Grid Reference ST 2087 4687

 Recording zero = 12.379m below Tide Gauge Bench Mark.

The Class-A channel 2 (digiquartz) had been beset by scaling problems since 30 January. Some values were retrieved from the back-up channel when TGI visited the site 2 March. The compressor for channel 2 pressure gauge failed 6 March and remained unserviceable until 5 April.

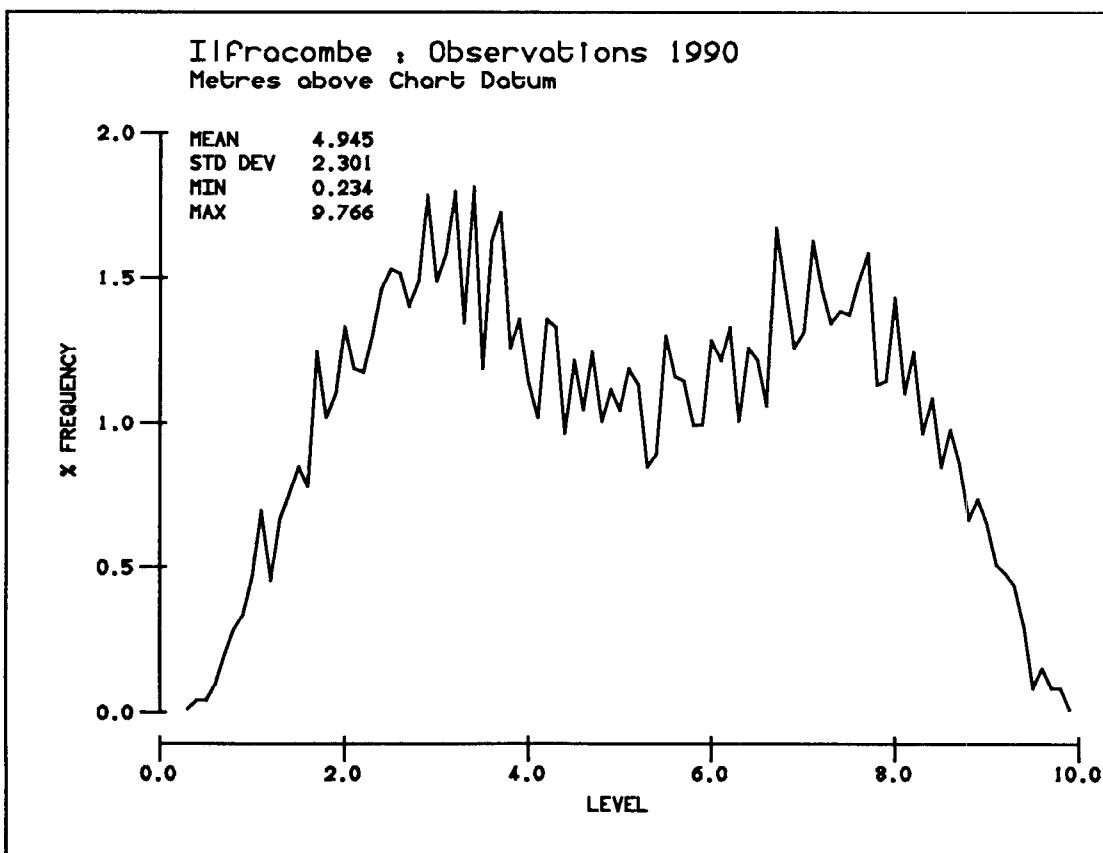

Values from the back-up potentiometer, although retained have not been used to fill the gap. Therefore no statistics are published for February or March for this site.

Power lines were brought down at this site during the February storms and the pier suffered some damage.

Spurious and missing scans were interpolated at the raw stage for the following dates: 15,30 Jan; 6,8 Feb; 24 Mar; 4,30 Apr; 25 Jun; 24,31 Jul; 8 Aug; 1,6,17 Sep; 28 Oct; 3 Dec. Scans integrated at 1 7/8 minute during TGI visit of 21 May were edited.

### Gaps in final filtered hourly levels for Channel 2

## Milford Haven

Values from a variety of tide gauge sites around Milford Haven have been collected since 1961. The Port Authority site at Hakin was upgraded and made operational via Dataring in December 1989 with two digiquartz sensors attached to pressure gauge systems. Unfortunately, for much of 1990 the channel 2 system was unserviceable, therefore statistics presented in this report stem from channel 1.

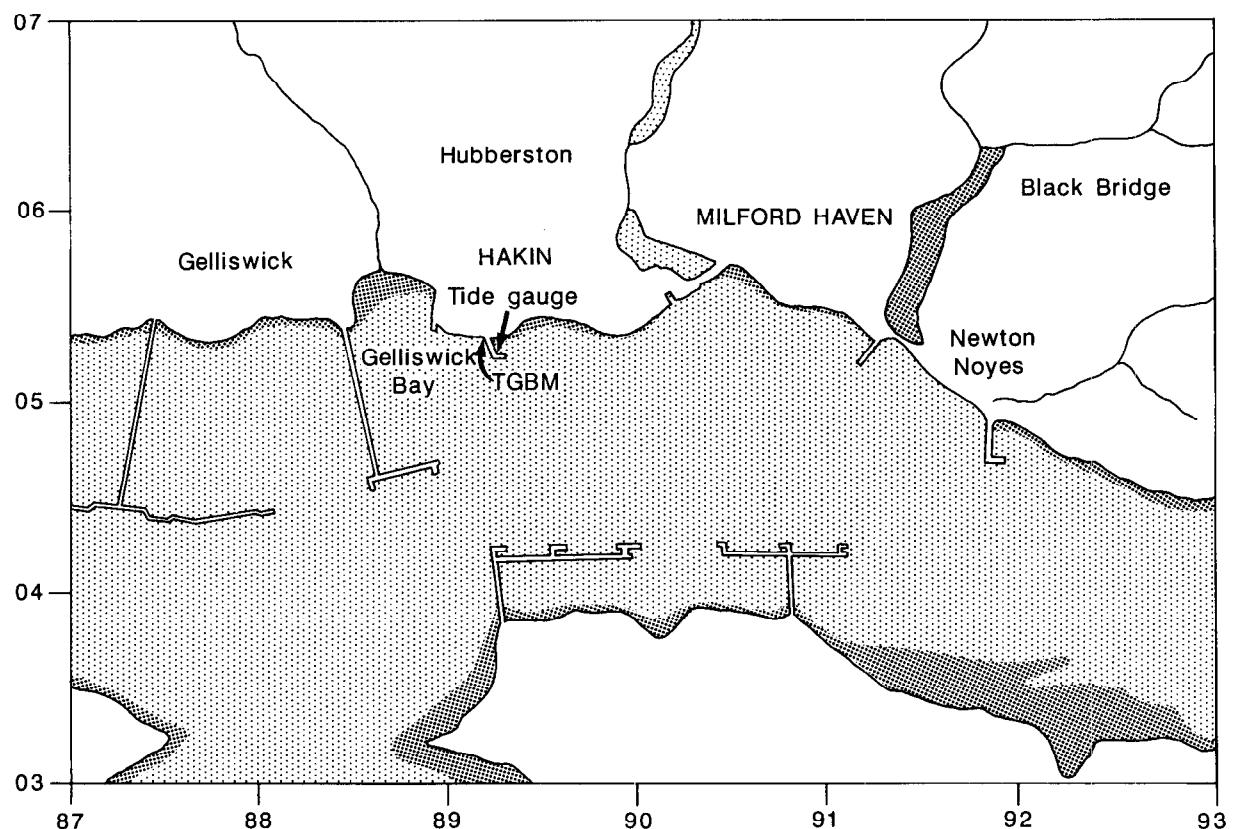

### Geographic and reference details

Latitude 51 deg 42' 21.5" N Longitude 05 deg 03' 2.1" W

## Mumbles

Mumbles is a new site to the network intended to replace Swansea, as briefly mentioned in the 1989 report. It has two differential pressure gauges linked to digiquartz transducers. Since installation in January 1989, it has suffered rather a chequered history in terms of both data quantity and quality.

Originally furnished with an Aanderaa pressure gauge system in November 1988, this site was upgraded to Dataring in January 1989. However, the installation was beset with problems with very little data retrieved in 1989. In 1990, the installation was damaged during the storm of 25 February and remained unserviceable until reinstated by the Tide Gauge Inspectorate (TGI) in August.

Graphs of the observed levels (overleaf) and statistics for the first seven months of 1990, presented in this report are from the back-up Aanderaa pressure recorder.

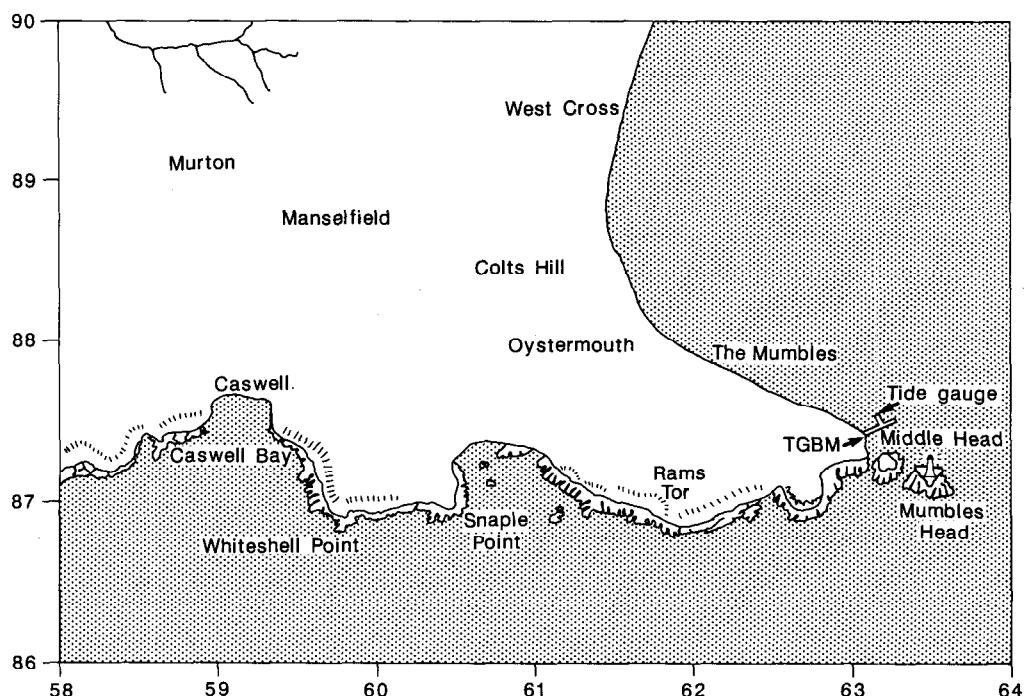

### Geographic and reference details

Latitude 51 deg 34' 10.0" N 03 deg 58' 28.3" W

National Grid Reference SS 6317 8752

Recording zero = Chart Datum = 5.0m below Ordnance Datum Newlyn

Recording zero = 13.821m below Tide Gauge Bench Mark

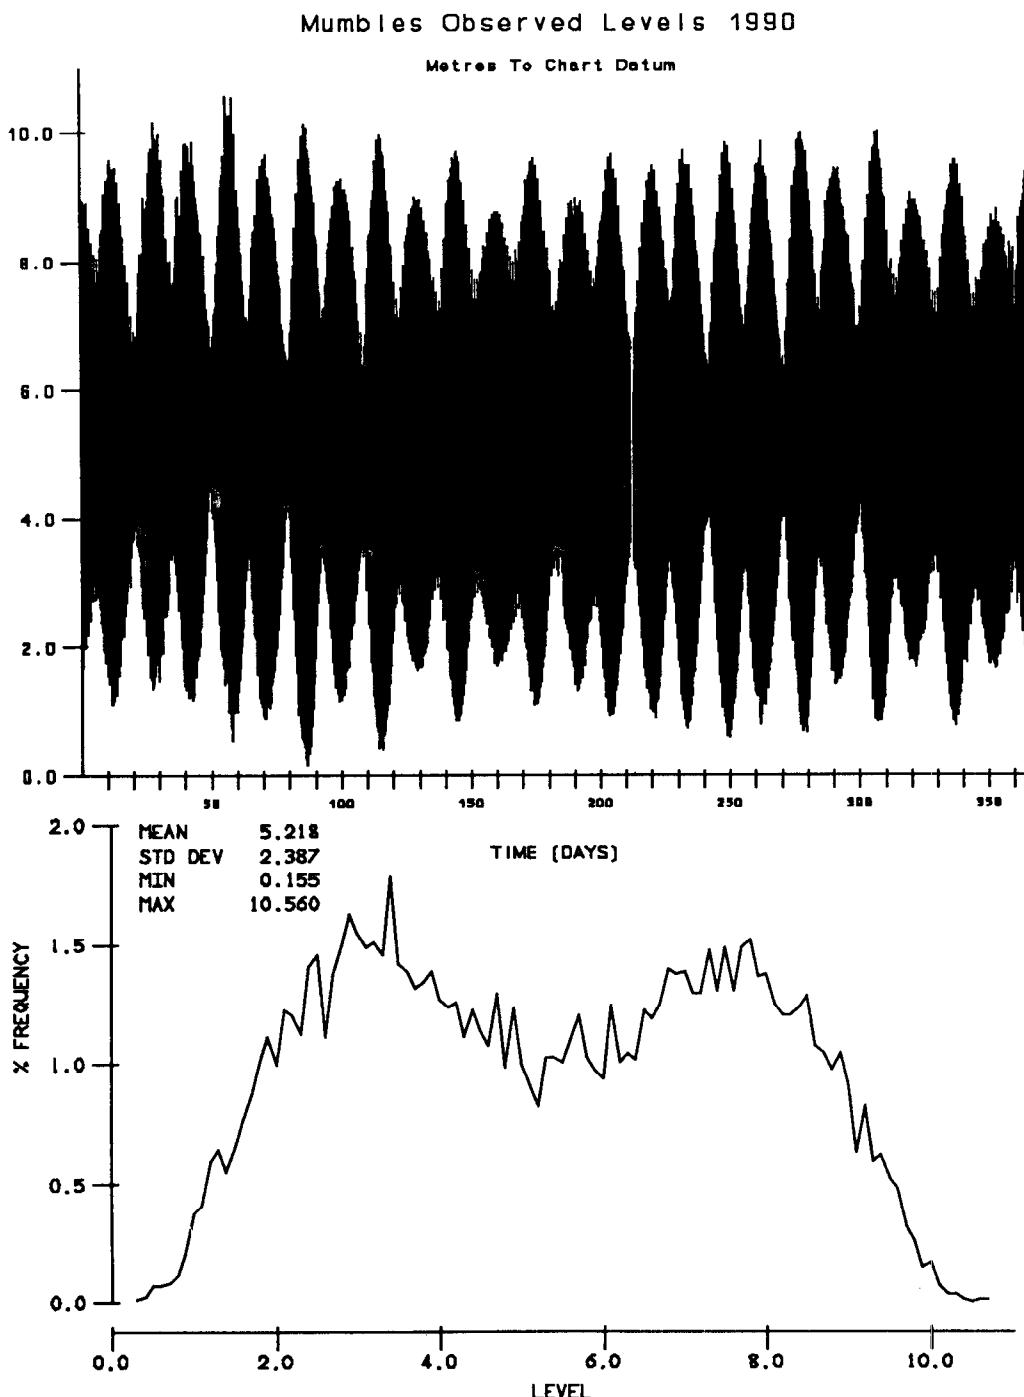

Bench Mark	NG co-ords	Description
TGBM	SS6298 8743	OSBM bolt Living Rock South side of road.
Aux1	SS6317 8752	OSBM bolt Lifeboat Station Mumbles Pier.
Aux2	SS6284 8750	OSBM bolt on concrete base of bollard, Lifeboat Cottage.

Full details of elevations obtained from the channel 2 digiquartz for 1990 are as follows:-  
 Isolated spurious and missing scans were interpolated on the following dates:  
 7,8,18,25(4),26,27,28,29(2),31 Jan; 6,11(5),12,13(6) Feb; 29 Aug; 1,19,27 Nov; 19,21(2) Dec.

#### Gaps in final processed hourly levels

04hrs. 23 January	- 06hrs. 24 January	Error in data store.
05hrs. 02 February	- 12hrs. 03 February	Data lost from store.
12hrs. 05 February	- 03hrs. 06 February	Data lost from store.
21hrs. 11 February	- 10hrs. 12 February	Data lost from store.
17hrs. 19 February	- 11hrs. 07 March	Data lost from store,then storm damage.
07hrs. 13 March	- 20hrs. 01 August	Installation awaiting repair.

In view of all the gaps and poor quality of the data retrieved from dataring until August, the back-up Aanderaa recording was processed for the period January to July.

## Newhaven

This site was upgraded to Dataring in November 1990 with two pressure gauge sensors to replace an Aanderaa pressure system which remains as a back-up recording.

Operational from 14 November, isolated spurious and missing scans in the raw data were interpolated for the following dates: 20 Nov.

However, the recordings seem to drift up to 5cms. in error by the 17 November and there were many other spikes and anomalous values throughout the series such that processing was abandoned for 1990.

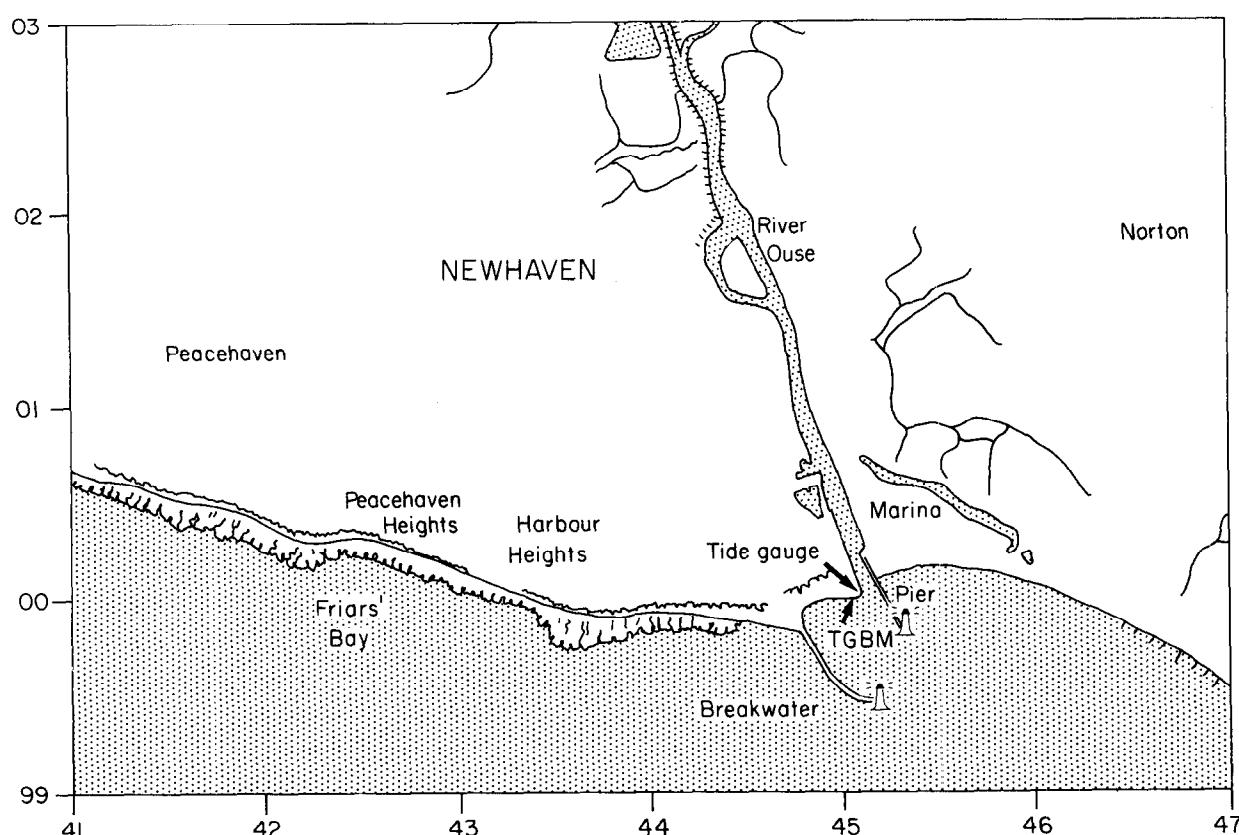

### Geographic and reference details

Latitude 50 deg 46' 52.6"N Longitude 00 deg 03' 30.0"E

National Grid Reference TQ 4509 0005

Recording Zero = Chart Datum = 3.52m below Ordnance Datum Newlyn

Recording Zero = 8.836m below Tide Gauge Bench Mark

Bench Mark	N.G. co-ords	Description
TGBM	TQ4510 0003	OSBM bolt on concrete surround 7.4m SW of SW angle of tower.
Aux1	TQ4495 0001	OSBM bolt on concrete sea wall 154.3m SW of tower.

**Newlyn**

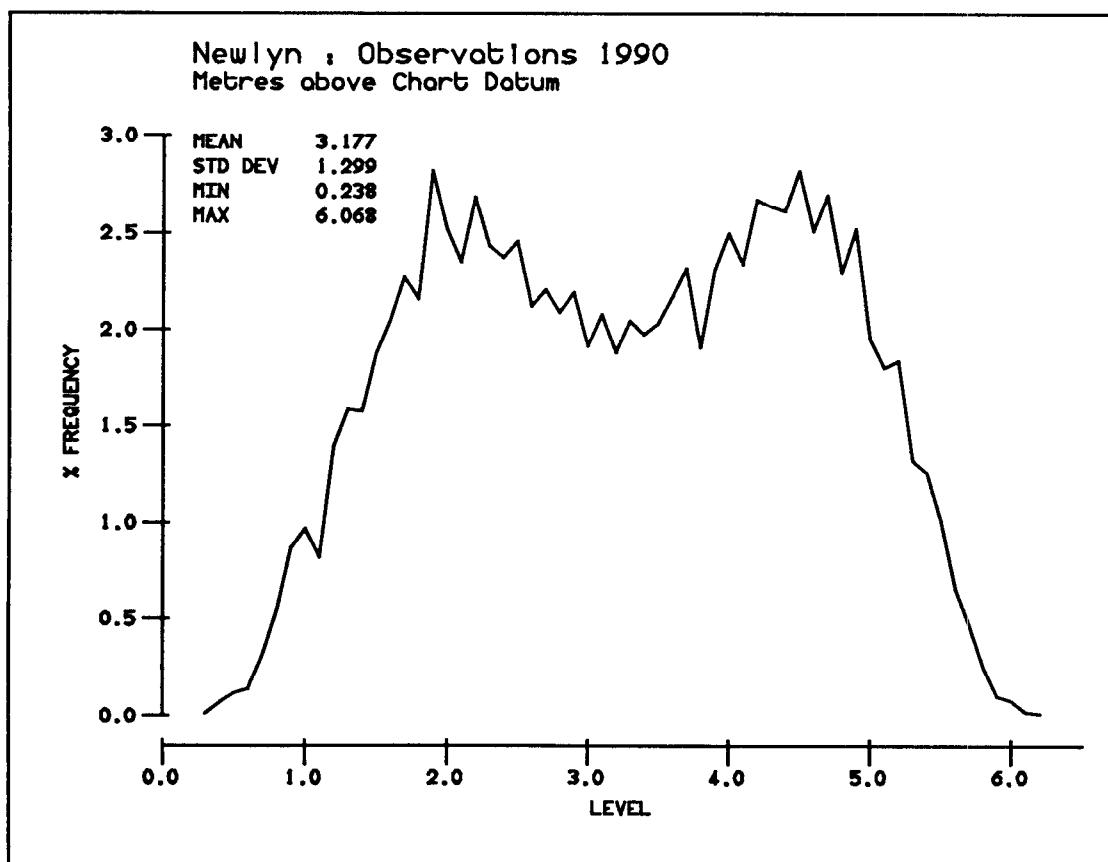

Latitude 50 deg 06' 8.4"N Longitude 05 deg 32' 30.6"W  
 National Grid Reference SW 4676 2855

Recording zero = Chart Datum = 3.05m below Ordnance Datum Newlyn  
 Recording zero = 7.8012m below Tide Gauge Bench Mark

Isolated spurious and missing scans in the raw data from the Channel 2 digiquartz were interpolated for the following dates : 9,16 Jan; 1,19,20 Feb; 8,15,26,30 Mar; 7,25 Apr; 3,5,14,22 Jun; 26 Jul; 4,7 Oct; 8 Nov; 15,17 Dec.

Scans integrated at 1 7/8 minute were edited for the 23 May over the period of a visit by TGI.

Despite many problems with the back-up potentiometer channel of data at this site, there were ultimately no gaps in the series of hourly data from channel 2 digiquartz for 1990.

 National Grid Reference NZ 3592 6823

Recording zero = Chart Datum = 2.6m below Ordnance Datum Newlyn  
 Recording zero = 6.515m below Tide Gauge Bench Mark

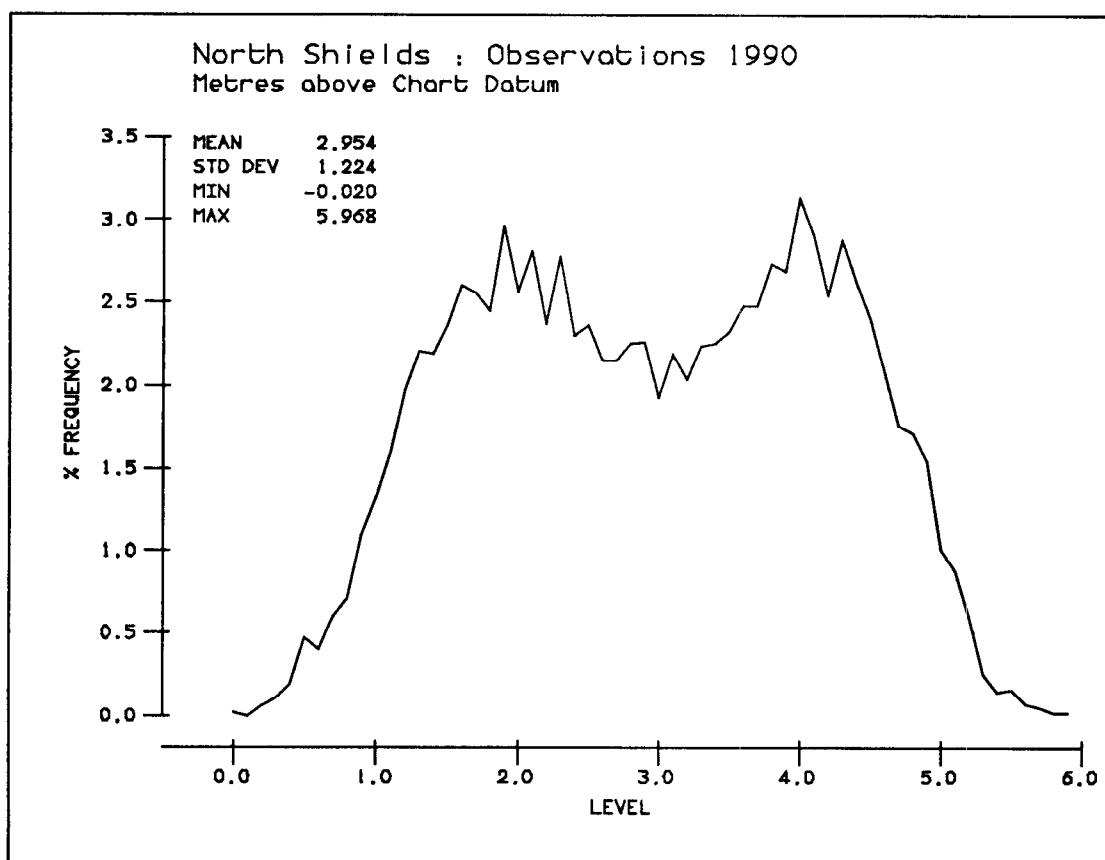

Prior to filtering to hourly heights, missing and spurious values in the Class A channel 2 data were interpolated for the following dates : 10 Jan; 3,30 Mar; 25 Apr; 23,31 May; 3,26 Jul; 9,24 Aug; 26 Sep.

Scans integrated at 1 7/8 minute over the TGI visit of 4 March were edited.

### Gaps in final processed hourly levels

17hrs 18 October - 15hrs 6 November Modem fault.

The TGI visited the site 6 November and fitted new processor and power boards.  
 From 6 November to the end of the year, duplicate values were recorded on both channels of data. These were removed as part of the processing procedure.

## Sheerness

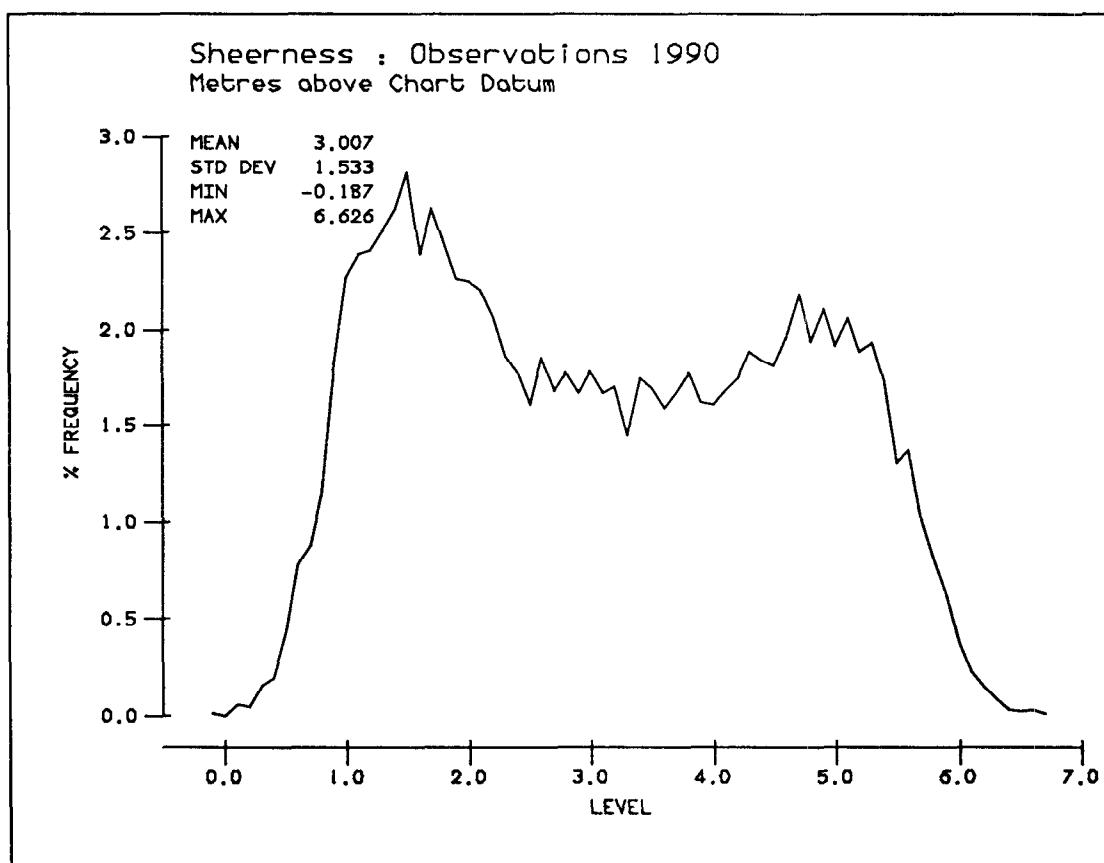

Latitude 51 deg 26' 42.4"N Longitude 00 deg 44' 41.9"E  
 National Grid Reference TQ 9073 7542

Recording zero = Chart Datum = 2.9m below Ordnance Datum Newlyn  
 Recording zero = 7.532m below Tide Gauge Bench Mark

The channel 2 digiquartz connected to a pressure point was treated as the Class-A channel of data. Isolated and missing values in the raw data were interpolated for the following dates: 23 Jan; 13,20,28 Feb; 6,19 Mar(2); 2,20 May; 13,19 Jun; 26 Jul; 21 Aug; 2,27 Sep; 14,25 Oct; 29 Nov; 27 Dec.

Scans integrated at 1 7/8 minute over the TGI visit of 27 November were edited.

Ultimately there were no gaps in processed data from Channel 2 digiquartz for 1990.  
 The pressure point tubing was replaced in August after a split in one tube was discovered.

## Stornoway

Latitude 58 deg 12' 28.6"N Longitude 06 deg 23' 17.5"W  
 National Grid Reference NB 4226 3271

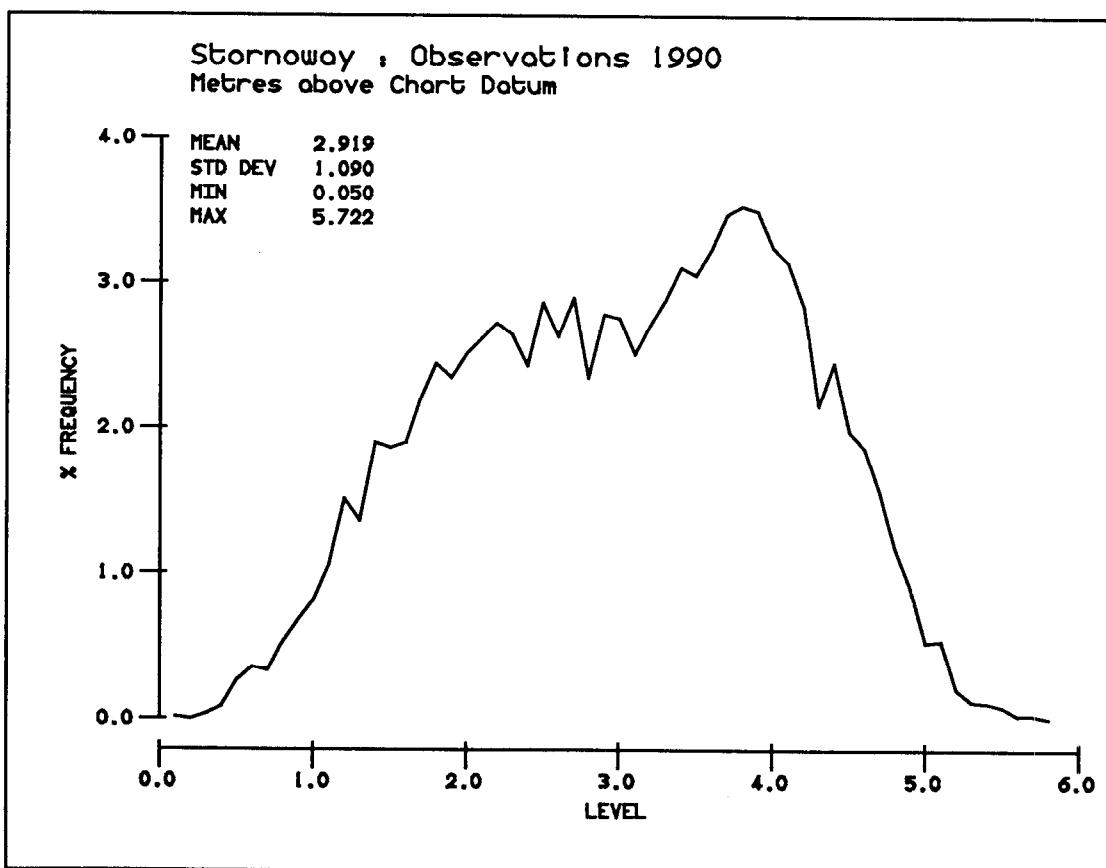

Recording zero = Chart Datum = 2.71m below Ordnance Datum Local  
 Recording zero = 6.368m below Tide Gauge Bench Mark

Isolated missing and spurious scans in the raw data from channel 2 digiquartz were interpolated for the following dates: 15 Feb; 17,21 Mar; 21 May; 4 Jun; 3,9(4) Jul; 30 Oct; 30 Nov; 2 Dec; 14 Dec.

Scans integrated at 1 7/8 minute, during the visit by TGI on 3 and 4 October to implement 'g' corrections, were also edited at the raw stage.

The equipment was damaged in the gales of 4 December.

The gap in final filtered data was from 00hrs GMT 4 December to 02hrs 14 December.

## Tobermory

Latitude 56 deg 37' 23.3"N Longitude 06 deg 03' 46.1W  
 National Grid reference NM 5081 5529

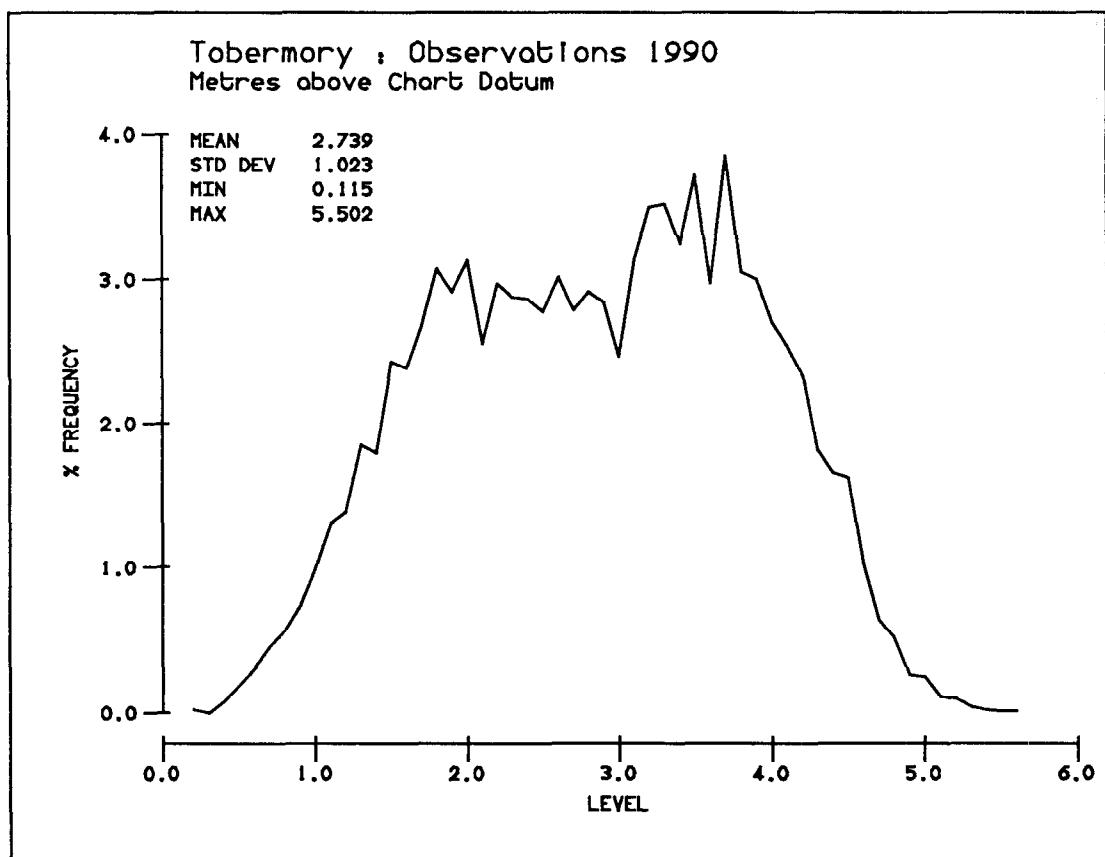

Recording zero = Chart Datum = 2.39m below Ordnance Datum Newlyn  
 Recording zero = 6.856m below Tide Gauge Bench Mark

After interpolation of isolated missing and spurious values in the raw data for the dates as listed below, hourly levels were filtered from the channel 2 digiquartz recordings.

12(4) Jan; 6 Feb; 8 Mar; 14 Mar; 4,11,24 Apr; 19 Jun; 22 Aug; 22,28 Sep; 8,19 Nov; 28 Dec.  
 Scans integrated at 1 7/8 minute during the TGI visit of 5 October were also edited at the raw stage.

TGI visited the site 5 October for routine maintenance and to apply gravitational corrections to the digiquartz sensor calibrations.

There were no gaps in the final filtered hourly values for 1990.

## Ullapool

Latitude 57 deg 53' 44.0"N Longitude 05 deg 09' 26.9"W  
 National Grid Reference NH 1288 9391

Recording zero = Chart Datum = 2.75m below Ordnance Datum Newlyn  
 Recording zero = 7.155m below Tide Gauge Bench Mark

After interpolation of isolated missing and spurious scans in the raw data for the dates listed below, hourly levels were filtered from the channel 2 digiquartz.

4 Feb; 13 Feb; 8 Aug; 1 Oct.

Scans integrated at 1 7/8 minute during the visit by TGI on 2 and 3 October were also edited at the raw stage.

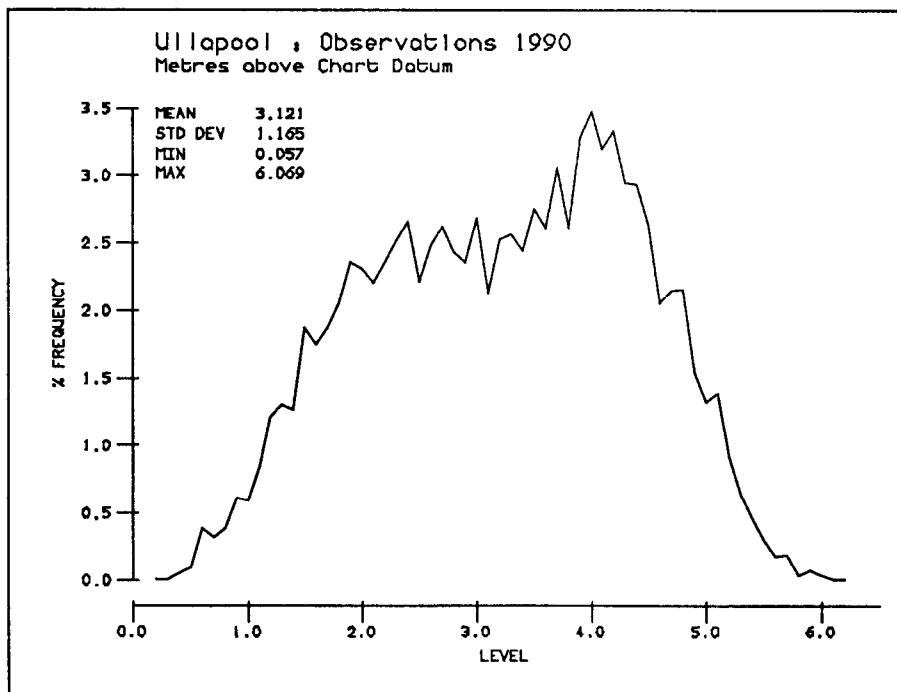

Problems with the clock appeared to begin towards the end of March with erratic timing. This was controlled to some extent from the central processor. By mid-April however, corrections had to be applied as part of the reduction process of the hourly levels.

Values were treated as being 4 minutes fast from 1200GMT 11 April until 1200GMT 17 April. From 1300GMT 17 April until 1300GMT 27 September they were treated as 7 minutes fast. The TGI visited the site to make repairs and fit a new clock 3 October.

The residual values (differences between observed and predicted) show a phase lag in May and June which indicates the conclusions reached about the clock error may be slightly in error but they represent a 'best-fit' scenario from evidence to hand. (See diagrams of residuals in Section 5)

### Gaps in hourly filtered data

### 3. Analysed data statistics

#### 3.1 Extreme Level Statistics

Levels for the year are presented as values referenced to Chart Datum for each site in alphabetical order. Where long series exist some indication of the relative magnitude is indicated. It must be noted these comparisons are with hourly levels only. Records of turning points extracted over the years show levels of the order of centimetres higher. Two storms dominate the extreme levels recorded at a number of sites, that of 26/27 February and 7 October.

#### **26 and 27 February**

At **Aberdeen** levels on 27 February were the highest recorded (Based on an incomplete series held dating from 1930).

At **Avonmouth** levels on 26 February were the highest ever (data series from 1924) as they also were at **Holyhead** (data series from 1964).

On 27 February, records were broken at **Lerwick** (records from 1959) and at **Wick** where levels equalled that recorded in 1981 (incomplete statistics from 1965).

At **North Shields** on the East coast the 27 February 1990 level was only exceeded in 1953 and 1969. (Incomplete records from 1953).

#### **7 October**

In terms of extremes, this storm may be a little deceptive in so far as sites displaying this as a record have only very short series. The site with the longest record involved and therefore probably giving the most realistic picture is **Dover** where the 1990 level was exceeded in 1953, 1961 and 1983 (based on an incomplete series dating from 1924). At **Whitby** the level of 6.473m above Chart Datum was the highest since records began in 1980 and at **Cromer** the 1990 level was also a record but based on a very short series dating from 1985.

#### 4.2 Mean Sea Level Values

Monthly values to Chart Datum calculated using the Doodson x0 filter are presented for 1990 with suffixes denoting missing days in each month. In accordance with the rules of the Permanent Service for Mean Sea Level (PSMSL), publishers of figures worldwide and based at POL, no monthly mean value is given where the number of days missing exceeds 15 in any one month. Similarly no annual mean value is given where the number of days missing exceeds one month.

As previously mentioned, the monthly mean values for January to July at Mumbles stem from the levels collected from the Aanderaa back-up recorder and adjusted for datum.

Plots of relative anomalies (monthly-annual) ordered geographically are shown for the three years 1988 to 1990 for ports where sufficient modernised data has been collated.

MSL Anomalies 1988-1990  
West Coast Ports  
(Millimetres)

MSL Anomalies 1988-1990  
East Coast Ports  
(Millimetres)

#### 4. Storm Surge Residuals

The larger anomalies, between the astronomically predicted level and the observed level, during 1990 were:-

(Figures 4-9 follow the text)

**January 17-18**

1.409m at Sheerness. (Figure 4)

Surges in excess of 1m occurred at all sites from North Shields southwards to Sheerness.

**January 25**

2.711m at Avonmouth. (Figure 5)

Surges of over a metre occurred at all sites from Ilfracombe northward to Heysham. Negative surges of 1.509m below predicted and 1.094m below predicted at Sheerness and Felixstowe, respectively.

The centre of the depression crossed Ireland during the morning and continued to deepen as it tracked east into southern Scotland and northern England, falling to a minimum of about 948mb when the storm was over the central North Sea. Mean wind speeds of 40kts occurred widely with speeds up to 50kts in some parts of Wales and southern England. Gusts of 90kts were reported.

**February 26**

2.662m at Heysham. (Figure 6)

Excessive damage was caused at Towyn in North Wales when the sea wall was breached, and flooding was extensive in parts of Devon, Cornwall, Somerset, south and west Wales, Northern Ireland and the west of Scotland.

Surge levels at Heysham remained over a metre above predicted levels for 11 hours, so although the maximum coincided with low tide, the effect at high tide was devastating.

**February 28**

1.995m at Avonmouth

Floods again occurred in the south west and along the English Channel.

**March 24**

1.198m at Sheerness

Surge levels over a metre above predicted at Immingham (Figure 7) and Lowestoft. No record available for Cromer.

**September 21**

1.372m at Sheerness

Surge levels were over a metre above predicted at all sites from Immingham southwards to Dover.

**October 6 and 7**

1.372m at Sheerness on 7th.

Surge levels of over a metre above predicted were observed at all ports Whitby to Sheerness. (Figure 8). A surge of 1.046m occurred at Heysham on the west coast on the 6th.

October 28

1.751m at Avonmouth

Above a metre at Heysham.

December 12

2.039m at Sheerness

Levels over 2m above predicted at Cromer and Lowestoft (Figure 9); over a metre at all ports North Shields southward to Dover.

December 25

Negative surge of -2.060m at Sheerness.

Lesser effects on all records from Immingham southward to Dover.

December 26

1.641m at Avonmouth

Levels remained over a metre above predicted at this site for 5 hours.

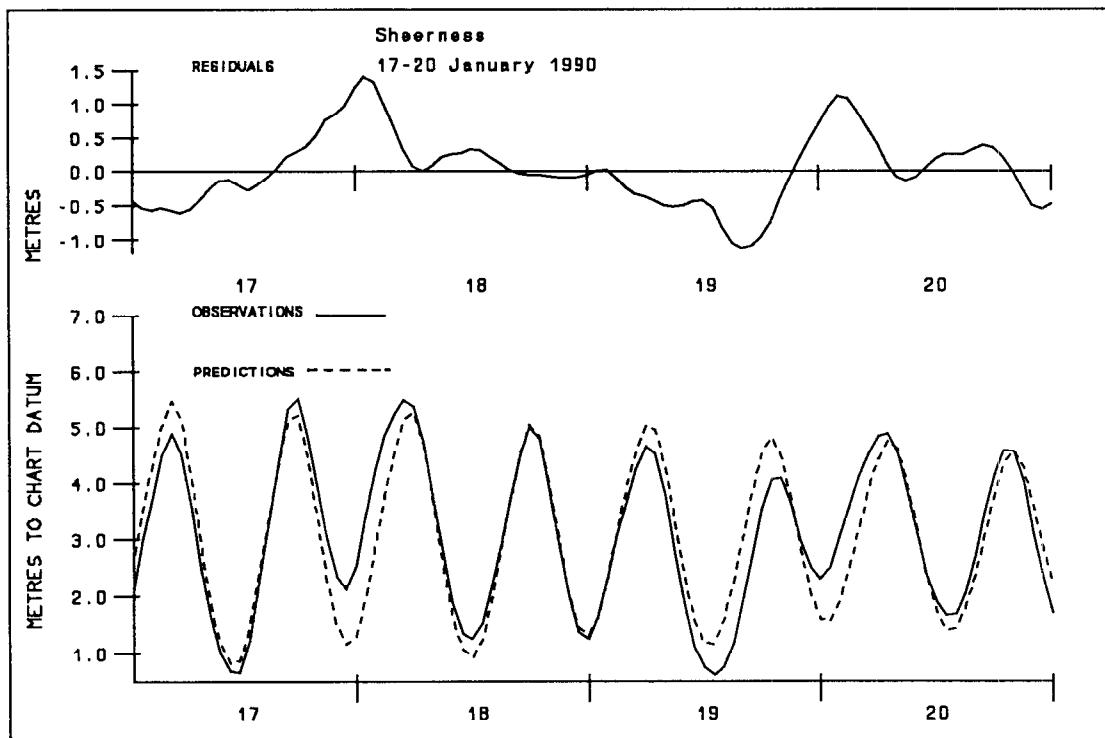

Figure 4. Hourly still water levels and residual surge, Sheerness 18 January

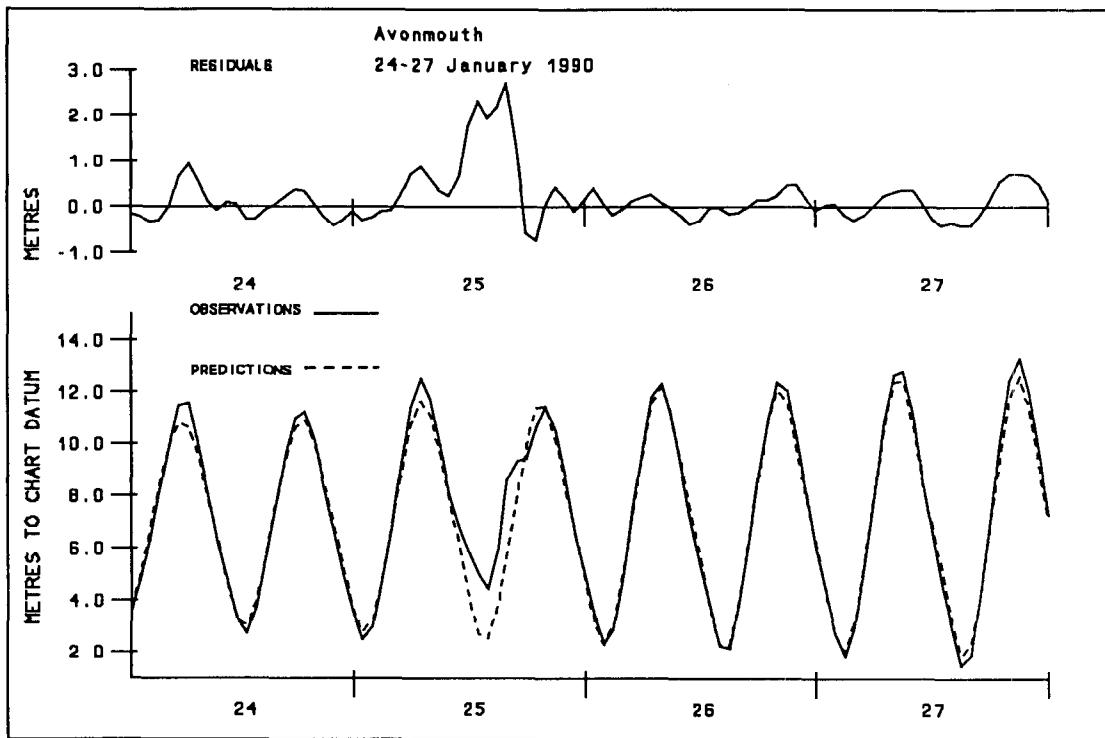

Figure 5. Hourly still water levels and residual surge Avonmouth 25 January.

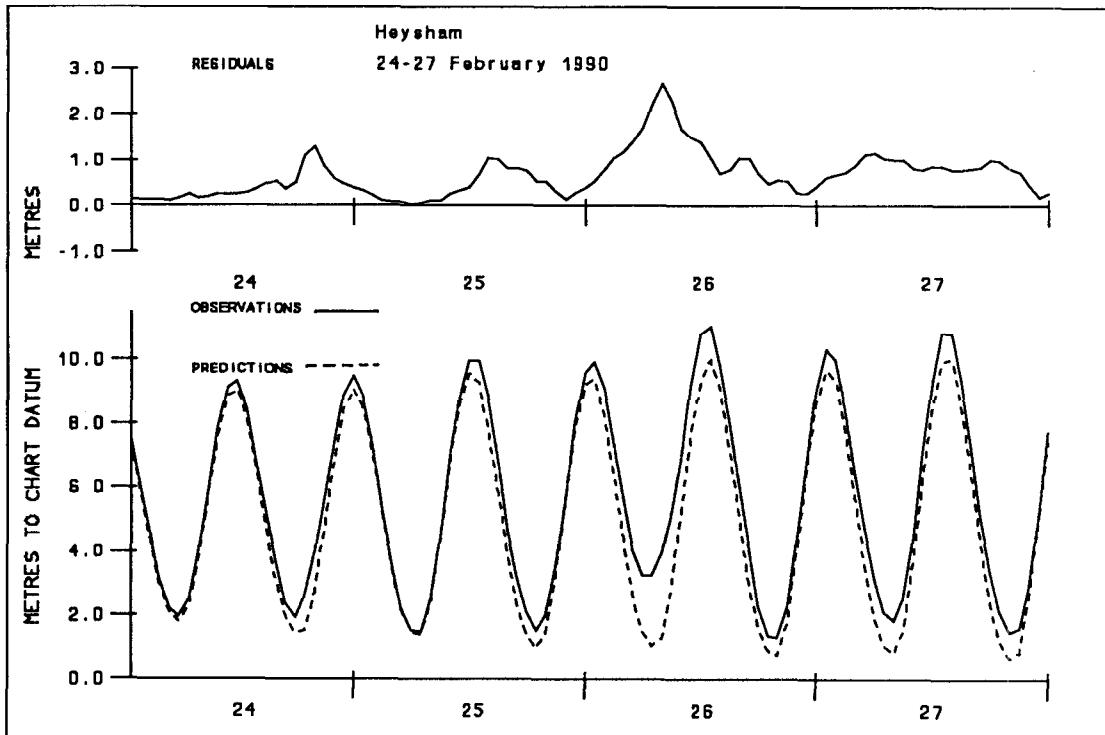

Figure 6. Hourly still water levels and residual surge Heysham 26 February.

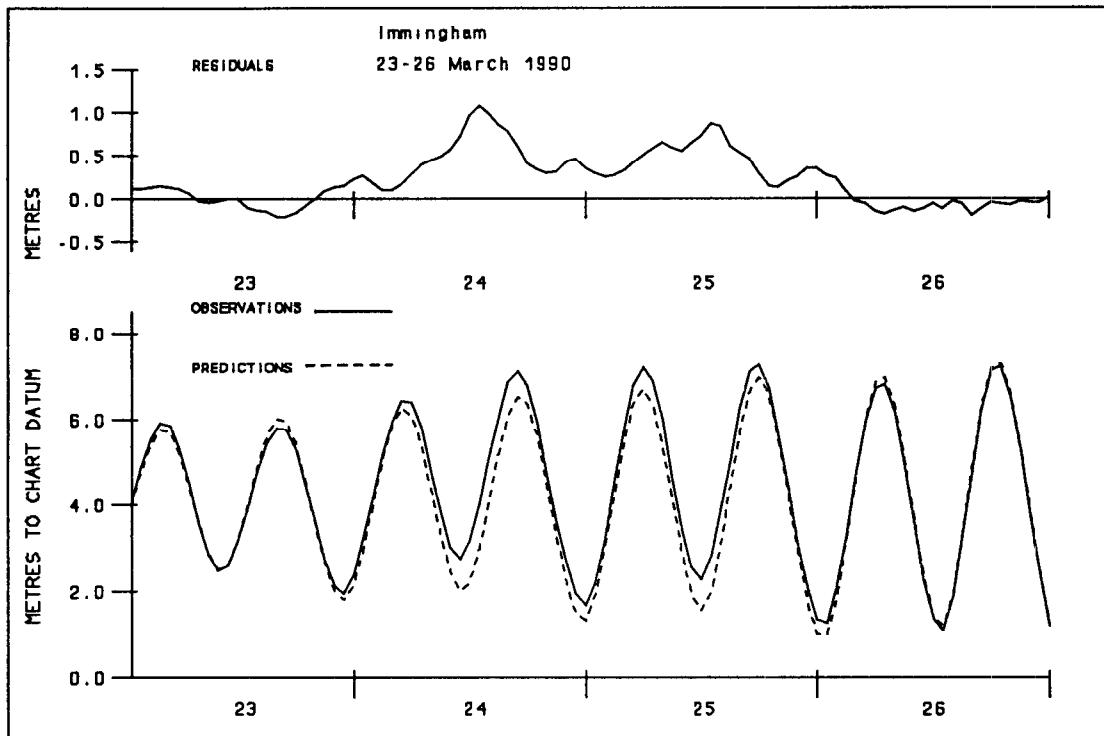

Figure 7. Hourly still water levels and residual surge Immingham 24 March.

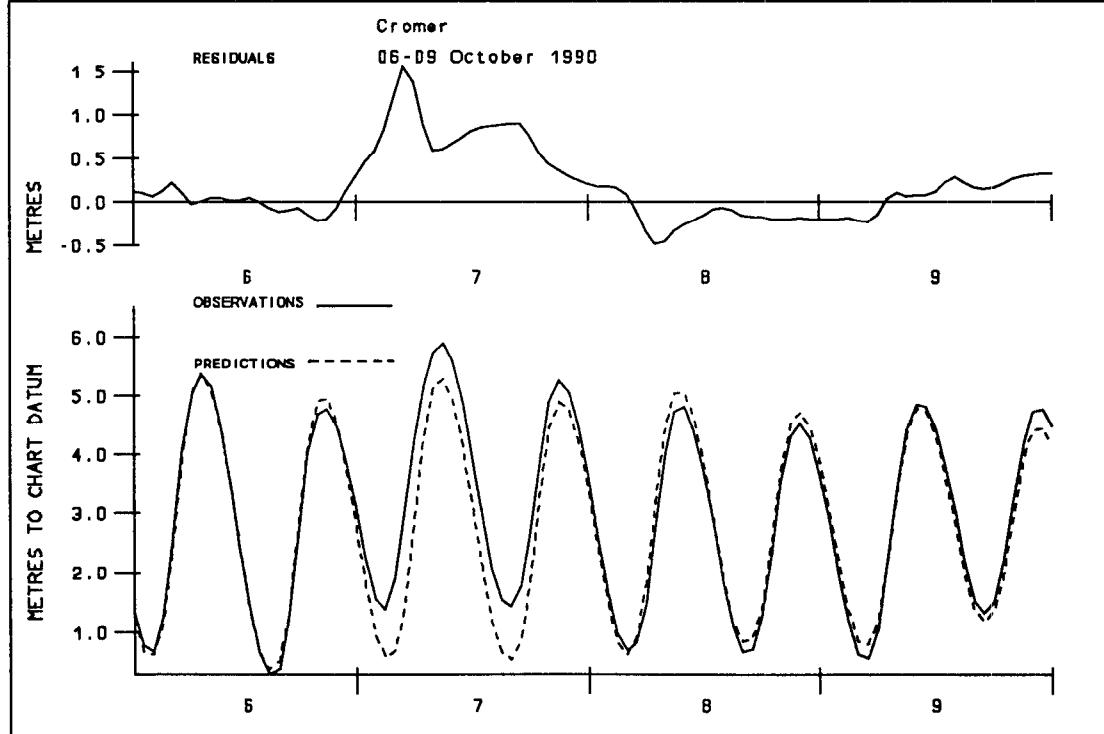

Figure 8. Hourly still water levels and residual surge Cromer 7 October.

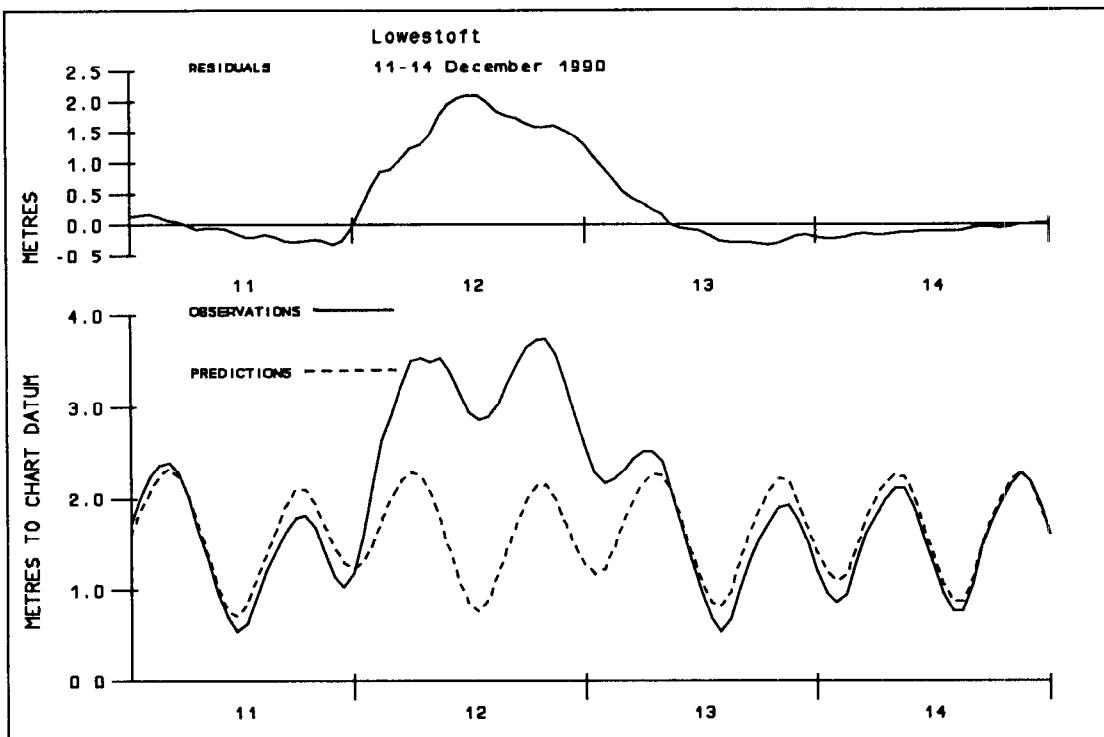

Figure 9. Hourly still water levels and residual surge Lowestoft 12 December.

On the following pages, monthly plots of storm surge residuals are presented for west and east coasts for all ports where relevant data are available. For example, no values are given for Hinkley Point or Mumbles as there is insufficient data for a meaningful analysis. Early studies of results have revealed an analytical problem similar to those found for Ilfracombe and Avonmouth in the Bristol Channel (Figure 10) and to a lesser degree, Leith in the Firth of Forth. At all these sites, the 'residuals' have a tidal semi-diurnal pattern which is to be further investigated.

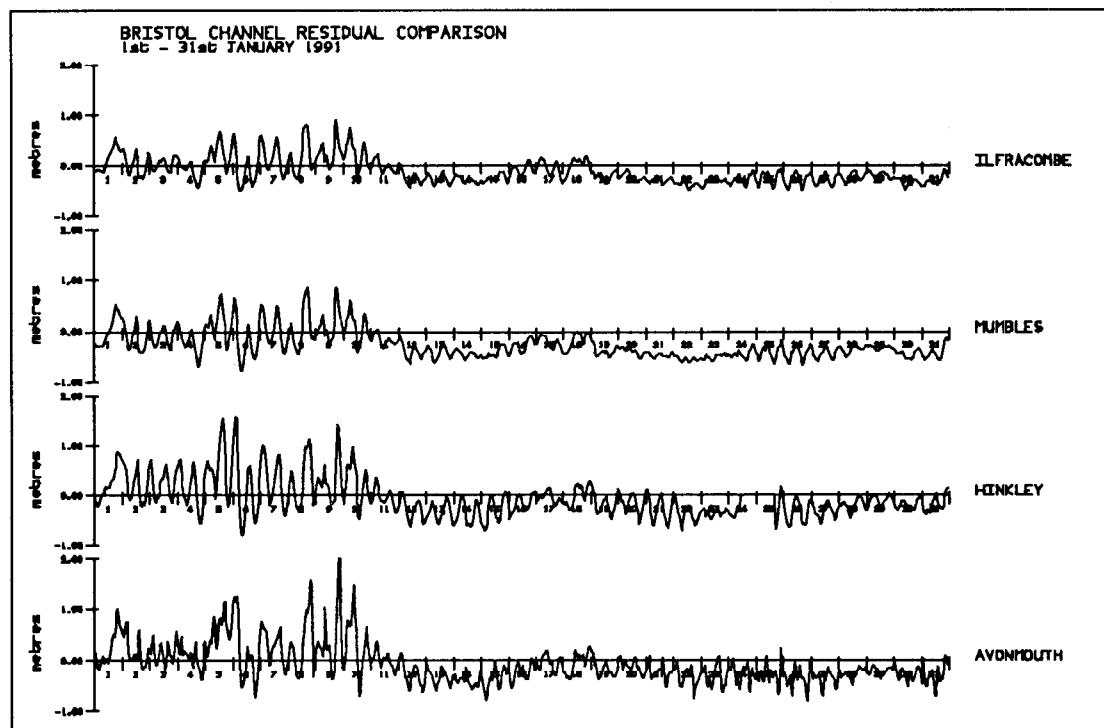

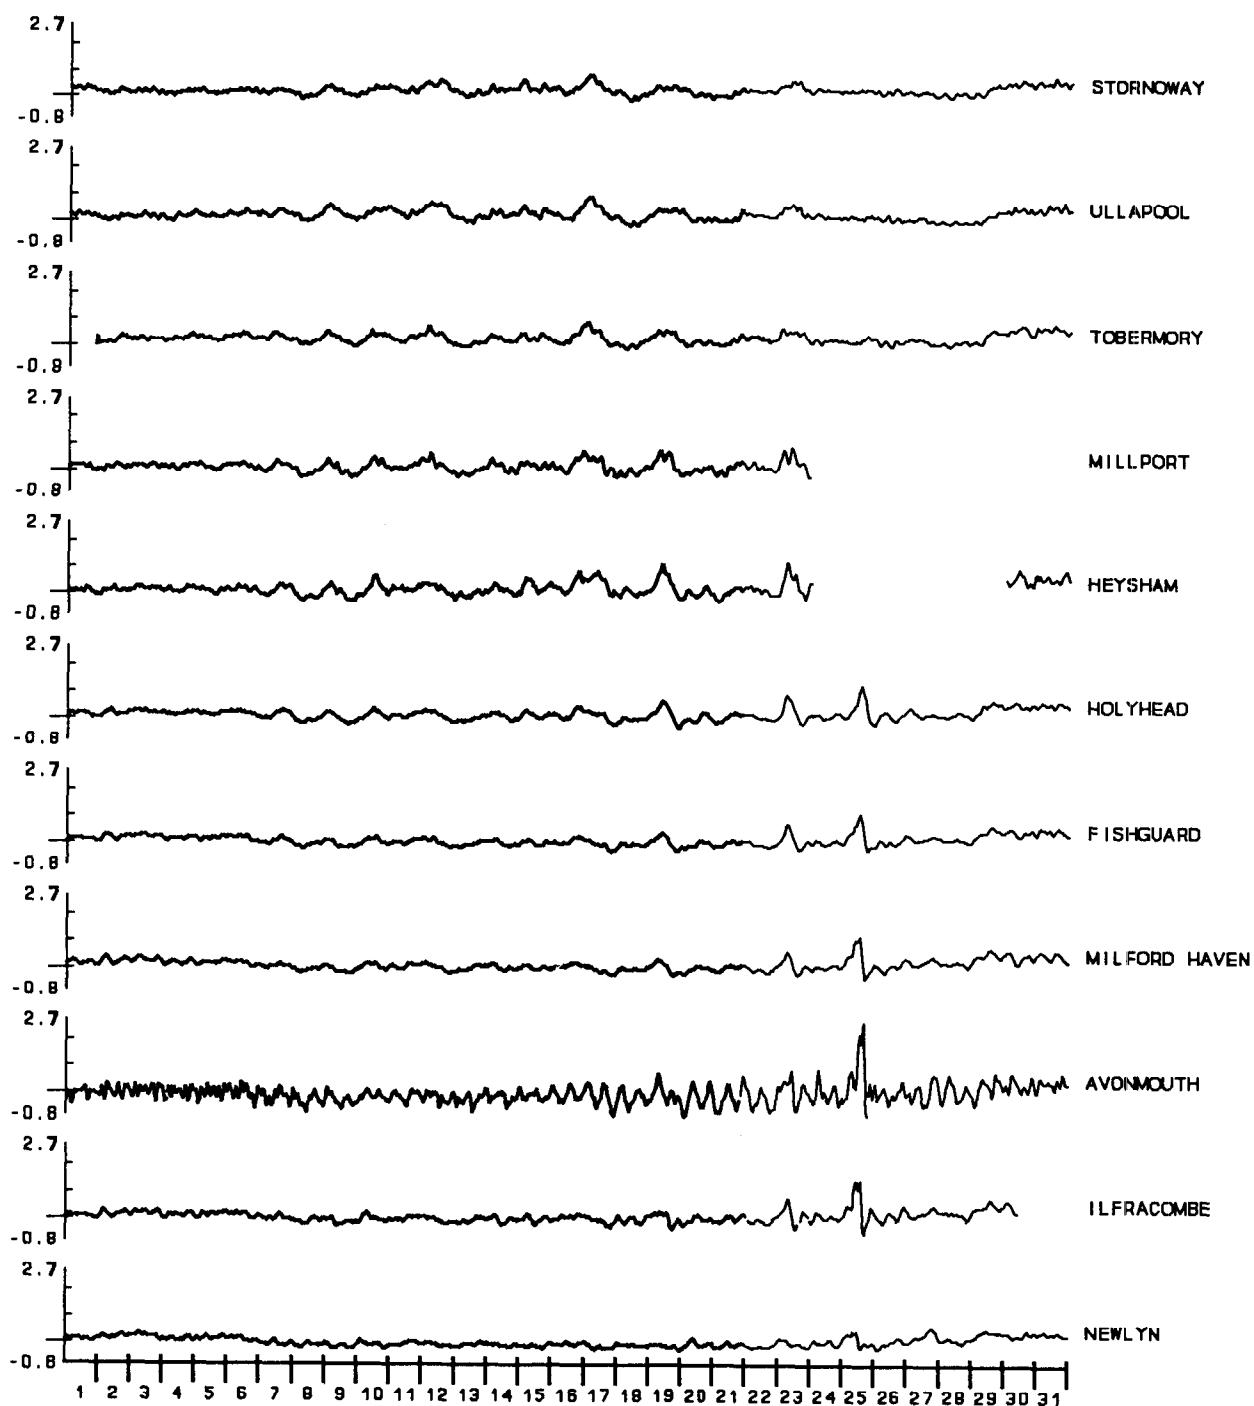

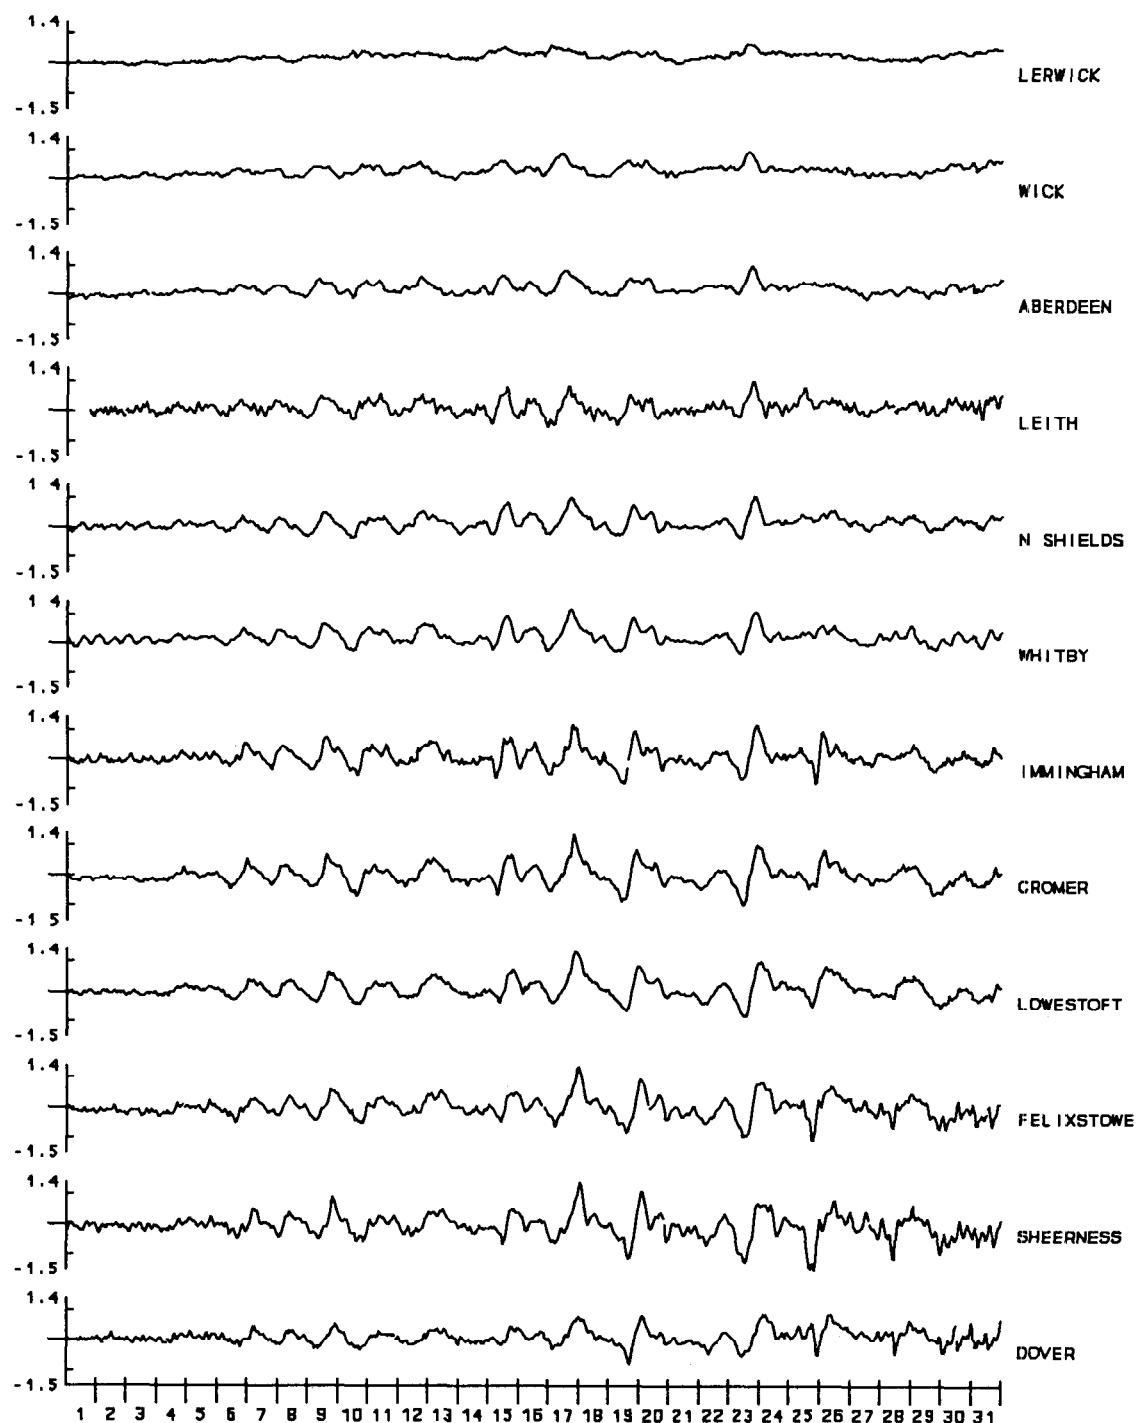

Figure 10.
