Executive Summary

This report presents a summary of the net emissions and removals of greenhouse gases for 1990-2011 by the Land Use, Land Use Change and Forestry sector of the UNFCCC National Inventory for each of the Devolved Administrations (England, Scotland, Wales and Northern Ireland). Supporting data is available at http://naei.defra.gov.uk/reports/reports?report_id=734. A full report for the UK is available in the 1990-2011 UK Greenhouse Gas Inventory Report, available on the National Atmospheric Emissions Inventory at http://naei.defra.gov.uk/reports/reports?report_id=747.

The LULUCF sector in England was a net source of GHG emissions in 2011 (1.733 Mt CO₂e). The size of this source has diminished since 1990 (6.011 Mt CO₂e).

The LULUCF sector in Scotland was a net sink of GHG emissions in 2011 (-5.270 Mt CO₂e). This sink increased steadily from 1990 (-2.055 Mt CO₂e) to 2010 (-5.505 Mt CO₂e) but has shrunk in 2011.

The LULUCF sector in Wales was a small net source of GHG emissions in 2011 (0.141 Mt CO₂e). Net emissions/removals have fluctuated between source and sink since 1990. The back-calculations of the inventory data have changed the 2010 value from a small net sink (-0.042 Mt CO₂e) in the 1990-2010 Inventory to a small net source (0.151 Mt CO₂e) in the 1990-2011 Inventory.

The LULUCF sector in Northern Ireland was a small net source in 2011 (0.180 Mt CO₂e) but was a small sink between 1992 and 2004.

Small changes between this and the 1990-2010 inventory are due to the inclusion of new activity data and some minor revisions in methods.

Introduction

The Land Use, Land Use Change and Forestry (LULUCF) sector includes carbon stock changes, emissions of greenhouse gases (carbon dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O)) by sources and removals of CO₂ by sinks from land use, land use change and forestry activities. Removals of CO₂ are conventionally presented as negative quantities. Total greenhouse gas emissions are described as carbon dioxide equivalents (CO₂e), using Global Warming Potentials (GWP) of 21 for CH₄ and 310 for N₂O (as used in the inventories submitted to the UNFCCC).

Detailed information on the data and methods used in the LULUCF inventory is available in the 1990-2011 UK Greenhouse Gas Inventory Report, available on the National Atmospheric Emissions Inventory website http://naei.defra.gov.uk/reports/reports?report_id=747. Chapter 7 and Annex 3.7 of the National Inventory Report contain information on the LULUCF sector, and Chapter 11 contains additional information on the reporting of LULUCF activities for the Kyoto Protocol. Additional information on LULUCF and KP-LULUCF inventory reporting will be made available at <http://ecosystemghg.ceh.ac.uk/> once the current restructuring of this website is complete.

The current LULUCF inventory methods use a combination of top-down and bottom-up approaches, based on activity data for each of the Devolved Administrations and the UK as a whole. As a result of this approach, estimates of emissions and removals from LULUCF activities are automatically produced at the DA and UK scale.

Net emissions and removals in greenhouse gases are summarised for each country and the reasons for differences from the previous inventory are provided. The trends in CO₂ emissions / removals are presented for each category within LULUCF, along with total emissions of methane and nitrous oxide. Summary tables for 1990, 1995, 2000, 2005 and 2010 are given in for each country in Appendix 1, and for LULUCF emissions/removals under the Kyoto Protocol in Appendix 2. Appendix 3 contains the annual Land Use Change matrices for each country. A full set of GHG emissions/removals and areas of land use change for each country are published with this report at http://naei.defra.gov.uk/reports/reports?report_id=734.

LULUCF Emissions and Removals in England

England is a net source of greenhouse gases from LULUCF activities although the size of this source has diminished by 71% between 1990 and 2011 from 6.011 to 1.733 Mt CO₂e (see Appendix 1 for emissions / removals by LULUCF category and gas). Net emissions of CO₂ from the Cropland and Settlement categories are diminishing over time, while net removals from the Grassland category are increasing (Figure 1). Net removals from the Forest Land category increased to 2004 but are now diminishing. The Wetlands and Harvested Wood Products categories make small contributions to the total.

Compared to the 1990-2010 Inventory, net emissions of greenhouse gases in the 1990-2011 inventory in 1990 have increased by 0.031 Mt CO₂e, an increase of 0.5%. Emissions in 2010 decreased by 0.0007 Mt CO₂e, equivalent to 0.04%. These differences were due to improvements in activity data (Table 1). Differences between the 2010 and 2011 inventories in each category are presented in Figure 3A & Figure 3B.

Figure 1: Net CO₂ emissions and removals by category for the LULUCF sector in England 1990-2011

Figure 2: Changes in net CO₂ emissions/removals 1990-2009 between the 2010 and 2011 inventories for England

Table 1: Improvements in the source data and/or methodology and their effects on Inventory data for England

IPCC Sector	Method and data revisions	Difference between 2011 and 2010 inventory estimates, kt CO ₂ e	
		1990	2010
5A Forest Land	Adjustments take account of new wildfires activity data and inclusion of DOM in biomass burning	68.83	-24.73
5B Cropland	Biomass and DOM losses following deforestation are now estimated from country-specific biomass densities. Also there is a correction of error in 2010 inventory (Settlements converted to Cropland)	16.62	-157.80
5C Grassland	New activity data for Forest Land converted to Grassland. Biomass and DOM losses following deforestation are now estimated using country-specific biomass densities.	-17.81	45.01
5D Wetlands	Extraction sites that are no longer active are assumed to be still producing on-site emissions. 2009-2010: new activity data published	0.00	107.20
5E Settlements	Revised activity data for Forest Land converted to Settlements. Biomass and DOM losses following deforestation are now estimated using country-specific biomass densities	-55.31	-17.58
5G Harvested Wood Products	Revised deforestation activity data affected the pool of harvested wood products.	0.00	49.81

Figure 3B: Differences in net CO₂ emissions / removals and emissions of non-CO₂ gases by category in England between the 2010 and 2011 Inventories

LULUCF Emissions and Removals in Scotland

Scotland is a net sink of greenhouse gases from LULUCF activities and the size of this sink has increased by 156% between 1990 and 2011 from -2.055 to -5.270 Mt CO₂e. There was a slight reduction in sink size between 2010 and 2011, due to long-term forest management (the extensive conifer plantations established in the mid-20th century are now reaching felling age, with reduced removals from forest and increased carbon stocks in harvested wood products). Net emissions/removals in Scotland are dominated by the large Forest Land sink (-7.382 Mt CO₂e in 2011) and Cropland source (4.780 Mt CO₂e in 2011) (Figure 4)

Compared to the 1990-2010 Inventory, net removals of greenhouse gases in the 1990-2011 inventory in 1990 have decreased by 0.043 Mt CO₂e, a net increase of 2%. Emissions in 2010 decreased by 0.050 Mt CO₂e, equivalent to 0.9%. These differences were due to improvements in activity data (Table 2). Differences between the 2010 and 2011 inventories in each category are presented in Figure 6A & Figure 6B.

5B Cropland	Biomass and DOM losses following deforestation are now estimated from country-specific biomass densities. Also there is a correction of error in 2010 inventory (Settlements converted to Cropland)	0.03	-20.28
5C Grassland	New activity data for Forest Land converted to Grassland. Biomass and DOM losses following deforestation are now estimated using country-specific biomass densities.	-18.46	24.87
5D Wetlands	Extraction sites that are no longer active are assumed to be still producing on-site emissions. 2009-2010: new activity data published	0.00	32.41
5E Settlements	Revised activity data for Forest Land converted to Settlements. Biomass and DOM losses following deforestation are now estimated using country-specific biomass densities	-30.28	16.76
5G Harvested Wood Products	Revised deforestation activity data affected the pool of harvested wood products.	0.00	-18.01

Figure 6A: Differences in net CO₂ emissions / removals by category in Scotland between the 2010 and 2011 Inventories

Figure 6B: Differences in net CO₂ emissions /removals and emissions of non-CO₂ gases by category in Scotland between the 2010 and 2011 Inventories

LULUCF Emissions and Removals in Wales

Over the inventory reporting period, Wales is generally a small net sink of greenhouse gases from LULUCF activities (Figure 7). However, it was a small net source between 1995 and 2000, and has become a net source again in 2010 and 2011 (0.141 Mt CO₂e). The Cropland net source (0.916 Mt CO₂e in 2011) is the largest contributor to the LULUCF sector in Wales, as the size of the Forest Land sink has diminished in recent years.

Compared to the 1990-2010 Inventory, net emissions of greenhouse gases in the 1990-2011 inventory in 1990 have increased (reduced sink) by 0.018 Mt CO₂e, an increase of 53%. Emissions in 2010 increased by 0.193 Mt CO₂e, equivalent to a 464% increase. Note that as Wales alternates between a small source and a small sink, changes in emissions / removals expressed as a percentage can give misleadingly high values. These differences were due to improvements in activity data (Table 3). Differences between the 2010 and 2011 inventories in each category are presented in Figure 9A & Figure 9B.

Figure 7: Net CO₂ emissions and removals by category for the LULUCF sector in Wales 1990-2011

		1990	2010
5A Forest Land	Adjustments take account of new wildfires activity data and inclusion of DOM in biomass burning	17.98	211.69
5B Cropland	Biomass and DOM losses following deforestation are now estimated from country-specific biomass densities. Also there is a correction of error in 2010 inventory (Settlements converted to Cropland)	0.00	-28.86
5C Grassland	New activity data for Forest Land converted to Grassland. Biomass and DOM losses following deforestation are now estimated using country-specific biomass densities.	-3.60	-5.03
5D Wetlands	No change	0.00	0.00
5E Settlements	Revised activity data for Forest Land converted to Settlements. Biomass and DOM losses following deforestation are now estimated using country-specific biomass densities	-7.15	1.85
5G Harvested Wood Products	Revised deforestation activity data changes the pool of harvested wood products.	0.00	-0.17

Figure 9A: Differences in net CO₂ emissions /removals by category in Wales between the 2010 and 2011 Inventories

Figure 9B: Differences in net CO₂ emissions / removals and emissions of non-CO₂ gases by category in Wales between the 2010 and 2011 Inventories

LULUCF Emissions and Removals in Northern Ireland

Northern Ireland was a small net source of greenhouse gases from LULUCF activities in 1990 of 0.098 Mt CO₂e, becoming a small net sink between 1992 and 2004 (reaching -0.155 Mt CO₂e in 1998), and has now returned to being a small net source (Figure 10) of 0.180 Mt CO₂e in 2011. The Cropland net source (0.937 Mt CO₂e in 2011) and the Grassland net sink (-1.181 Mt CO₂e in 2011) are the largest contributors to the LULUCF sector in Northern Ireland.

Compared to the 1990-2010 Inventory, net emissions of greenhouse gases in the 1990-2011 inventory in 1990 have increased by 0.044 Mt CO₂e, an increase of 80%. Emissions in 2010 increased by 0.036 Mt CO₂e, equivalent to 34%. Note that as Northern Ireland alternates between a small source and a small sink, changes in emissions / removals expressed as a percentage can give misleadingly high values. These differences were due to improvements in activity data (Table 4). Differences between the 2010 and 2011 inventories in each category are presented in Figure 12A & Figure 12B.
