## Abstract

We present a genome assembly from an individual male *Parapoynx stratiotata* (the ringed china-mark; Arthropoda; Insecta; Lepidoptera; Crambidae). The genome sequence is 478 megabases in span. The majority of the assembly (99.98%) is scaffolded into 30 chromosomal pseudomolecules, with the Z sex chromosome assembled. The mitochondrial genome was also assembled and is 15.4 kilobases in length.

## Keywords

Parapoynx stratiotata, ringed china-mark, genome sequence, chromosomal, Lepidoptera

## Species taxonomy

Eukaryota; Metazoa; Ecdysozoa; Arthropoda; Hexapoda; Insecta; Pterygota; Neoptera; Endopterygota; Lepidoptera; Glossata; Ditrysia; Pyraloidea; Crambidae; Nymphulinae; Parapoinx; *Parapoinx stratiotata* (Linnaeus, 1758) (NCBI:txid1594321).

## Background

*Parapoinx stratiotata* (ringed china-mark) is a crambid moth with a recognisable dark ring with a white centre on the forewing. The female is larger (28–30 mm wingspan) and has a darker orange-brown forewing, while the males are smaller (20–24 mm wingspan) and have pale ochre forewings. *Parapoinx stratiotata* is a Palearctic species with a wide distribution across Europe. It is found across Britain and Ireland but is rarer in Scotland.

This species is part of the Acentropinae (Nymphulinae) sub-family, which have all adapted to life in freshwater environments (Léger *et al.*, 2021; Regier *et al.*, 2012). The larvae of this aquatic moth live completely submerged in water and rely on aquatic plants for food and habitat, while the adults are terrestrial. The female lays the eggs into water by placing her abdomen below the water surface. As such, the adults are found mostly near the margins of ponds and lakes, marshes and slow-flowing rivers. The larvae possess branched tracheal gills on all segments except the prothorax, which are used for breathing, and build a portable tube-like case (Vallenduuk & Cuppen, 2004), typical of the *Parapoinx*-type larva form. The larvae may be important components of freshwater habitats, altering water quality through stimulation of nutrient release, particularly phosphorus (Grutters *et al.*, 2016). The larvae are also phytophagous, like most lepidopterans, and were found to feed on both native and exotic plants pointing to their potential usefulness for biotic resistance to invading pest species (Grutters *et al.*, 2016; Habeck, 1983).

*Parapoinx stratiotata* is a key lepidopteran representative for the underrepresented aquatic insects (Hotaling *et al.*, 2020). Analysis of a genome sequence for this species will provide vital insight for understanding how insects, including Lepidoptera (Pabis, 2018), have adapted to live in aquatic environments.

The genome of *P. stratiotata* was sequenced as part of the Darwin Tree of Life Project, a collaborative effort to sequence all of the named eukaryotic species in the Atlantic Archipelago of Britain and Ireland. Here we present a chromosomally complete genome sequence for *P. stratiotata*, based on one male specimen from Wytham Woods, Oxfordshire, UK.

## Genome sequence report

The genome was sequenced from a single female *P. stratiotata* (ilParStra1; Figure 1) collected from Wytham Woods, Oxfordshire (biological vice-country: Berkshire), UK (latitude 51.764, longitude -1.327). A total of 26-fold coverage in Pacific Biosciences single-molecule long reads and 101-fold coverage in 10X Genomics read clouds were generated. Primary assembly contigs were scaffolded with chromosome conformation Hi-C data. Manual assembly curation corrected 23 missing/misjoins and removed 7 haplotypic duplications, reducing the assembly size

by 1.02% and the scaffold number by 23.81%, and increasing the scaffold N50 by 3.54%.

The final assembly has a total length of 478 Mb in 32 sequence scaffolds with a scaffold N50 of 12.2 Mb (Table 1). Of the assembly sequence, 99.98% was assigned to 30 chromosomal-level scaffolds, representing 29 autosomes (numbered by sequence length), and the Z sex chromosome (Figure 2–Figure 4; Table 2). The assembly has a BUSCO (Manni *et al.*, 2021) completeness of 98.4% (single 98.0%, duplicated 0.4%) using the lepidoptera\_odb10 reference set (n=5286). While not fully phased, the assembly deposited is of one haplotype. Contigs corresponding to the second haplotype have also been deposited.

## Methods

### Sample acquisition and nucleic acid extraction

One male *P. stratiotata* (ilParStra1) and one *P. stratiotata* of unknown sex (ilParStra3) were collected from Wytham Woods, Oxfordshire, UK (ilParStra1: latitude 51.765, longitude -1.335; ilParStra3: latitude 51.764, longitude -1.327) by Douglas Boyes, UKCEH, from woodland using a light trap. The specimens were identified by the same individual and preserved on dry ice. A third (larval) specimen of unknown sex was collected from Snakeholm Pit, Lincolnshire, UK (latitude 53.230, longitude -0.330) by Richard Chadd, UK Environment Agency, from freshwater using a kicknet. The specimen was identified by the same individual and snap-frozen on dry ice.

DNA was extracted from whole organism tissue of ilParStra1 at the Wellcome Sanger Institute (WSI) Scientific Operations core from the whole organism using the Qiagen MagAttract HMW DNA kit, according to the manufacturer's instructions. RNA was extracted from whole organism larval tissue of ilParStra2 in the Tree of Life Laboratory at the WSI using TRIzol (Invitrogen), according to the manufacturer's instructions. RNA was then eluted in 50 µl RNase-free water and its concentration RNA assessed using a Nanodrop spectrophotometer and Qubit

**Figure 1.** Image of the *Parapoinx stratiotata* (ilParStra1) specimen taken prior to preservation and processing.

Fluorometer using the Qubit RNA Broad-Range (BR) Assay kit. Analysis of the integrity of the RNA was done using Agilent RNA 6000 Pico Kit and Eukaryotic Total RNA assay.

### Sequencing

Pacific Biosciences HiFi circular consensus and 10X Genomics Chromium read cloud sequencing libraries were constructed according to the manufacturers' instructions. Poly(A) RNA-Seq libraries were constructed using the NEB Ultra II RNA Library Prep kit. Sequencing was performed by the Scientific Operations core at the Wellcome Sanger Institute on Pacific Biosciences SEQUEL II (HiFi), Illumina HiSeq X (10X) and Illumina HiSeq 4000 (RNA-Seq) instruments. Hi-C data were

generated from abdomen tissue of ilParStra3 using the Arima v2 Hi-C kit and sequenced on an Illumina NovaSeq 6000.

### Genome assembly

Assembly was carried out with Hifiasm (Cheng *et al.*, 2021); haplotypic duplication was identified and removed with purge\_dups (Guan *et al.*, 2020). One round of polishing was performed by aligning 10X Genomics read data to the assembly with longranger align, calling variants with freebayes (Garrison & Marth, 2012). The assembly was then scaffolded with Hi-C data (Rao *et al.*, 2014) using SALSA2 (Ghurye *et al.*, 2019). The assembly was checked for contamination and corrected using the gEVAL system (Chow *et al.*, 2016) as described

### Scaffold statistics

Dataset: CAJUUF01

**Figure 2. Genome assembly of *Paraponyx stratiotata*, ilParStra1.1: metrics.** The BlobToolKit Snailplot shows N50 metrics and BUSCO gene completeness. The main plot is divided into 1,000 size-ordered bins around the circumference with each bin representing 0.1% of the 478,248,748 bp assembly. The distribution of chromosome lengths is shown in dark grey with the plot radius scaled to the longest chromosome present in the assembly (22,161,367 bp, shown in red). Orange and pale-orange arcs show the N50 and N90 chromosome lengths (17,072,597 and 12,933,045 bp), respectively. The pale grey spiral shows the cumulative chromosome count on a log scale with white scale lines showing successive orders of magnitude. The blue and pale-blue area around the outside of the plot shows the distribution of GC, AT and N percentages in the same bins as the inner plot. A summary of complete, fragmented, duplicated and missing BUSCO genes in the lepidoptera\_odb10 set is shown in the top right. An interactive version of this figure is available at <https://blobtoolkit.genomehubs.org/view/ilParStra1.1/dataset/CAJUUF01/snail>.

**Figure 3. Genome assembly of *Paraponyx stratiotata*, ilParStra1.1: cumulative sequence.** BlobToolKit cumulative sequence plot. The grey line shows cumulative length for all scaffolds. Coloured lines show cumulative lengths of scaffolds assigned to each phylum using the buscogenes taxrule. An interactive version of this figure is available at <https://blobtoolkit.genomehubs.org/view/ilParStra1.1/dataset/CAJUUF01/cumulative>.

previously (Howe *et al.*, 2021). Manual curation (Howe *et al.*, 2021) was performed using gEVAL, HiGlass (Kerpedjiev *et al.*, 2018) and Pretext. The mitochondrial genome was assembled using MitoHiFi (Uliano-Silva *et al.*, 2021), which performed

annotation using MitoFinder (Allio *et al.*, 2020). The genome was analysed and BUSCO scores generated within the BlobToolKit environment (Challis *et al.*, 2020). Table 3 contains a list of all software tool versions used, where appropriate.

**Figure 4. Genome assembly of *Paraponyx stratiotata*, ilParStra1.1: Hi-C contact map.** Hi-C contact map of the ilParStra1.1 assembly, visualised in HiGlass. Chromosomes are shown in size order from left to right and top to bottom. The interactive Hi-C map can be viewed [here](#).

### Ethics/compliance issues

The materials that have contributed to this genome note have been supplied by a Darwin Tree of Life Partner. The submission of materials by a Darwin Tree of Life Partner is subject to the [Darwin Tree of Life Project Sampling Code of Practice](#). By agreeing with and signing up to the Sampling Code of Practice, the Darwin Tree of Life Partner agrees they will meet the legal and ethical requirements and standards set out within this document in respect of all samples acquired for, and supplied to, the Darwin Tree of Life Project. Each transfer of samples is further undertaken according to a Research Collaboration Agreement or Material Transfer Agreement entered into by the Darwin Tree of Life Partner, Genome Research Limited (operating as the Wellcome Sanger Institute), and in some circumstances other Darwin Tree of Life collaborators.

### Data availability

European Nucleotide Archive: Paraponyx stratiotata (ringed china-mark). Accession number [PRJEB45129](#); <https://identifiers.org/ena.embl/PRJEB45129>.

The genome sequence is released openly for reuse. The *P. stratiotata* genome sequencing initiative is part of the [Darwin Tree of Life](#) (DToL) project. All raw sequence data and the assembly have been deposited in INSDC databases. The genome will be annotated using the RNA-Seq data and presented

through the [Ensembl](#) pipeline at the European Bioinformatics Institute. Raw data and assembly accession identifiers are reported in [Table 1](#).

### Clément Schneider

LOEWE Centre for Translational Biodiversity Genomics (LOEWE-TBG), Frankfurt am Main, Germany

The authors present a de novo chromosome-level assembly for a Lepidoptera. Species biology is briefly summarized, and genome assembly statistics are provided. The method is sound and up-to-date, the genome can be considered nearly complete and of high quality, making it a valuable and reliable resource. No debatable discussion is involved.

**Is the rationale for creating the dataset(s) clearly described?**

Yes

**Are the protocols appropriate and is the work technically sound?**

Yes

**Are sufficient details of methods and materials provided to allow replication by others?**

Yes

**Are the datasets clearly presented in a useable and accessible format?**

Yes

**Competing Interests:** No competing interests were disclosed.

**Reviewer Expertise:** Entomology

**I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard.**
