## **BRITISH GEOLOGICAL SURVEY**

The full range of Survey publications is available from the BGS Sales Desk at Nottingham, Edinburgh and London; see contact details below or shop online at [www.geologyshop.com](http://www.geologyshop.com)

The London Information Office also maintains a reference collection of BGS publications including maps for consultation.

The Survey publishes an annual catalogue of its maps and other publications; this catalogue is available from any of the BGS Sales Desks.

*The British Geological Survey carries out the geological survey of Great Britain and Northern Ireland (the latter as an agency service for the government of Northern Ireland), and of the surrounding continental shelf, as well as its basic research projects. It also undertakes programmes of British technical aid in geology in developing countries as arranged by the Department for International Development and other agencies.*

*The British Geological Survey is a component body of the Natural Environment Research Council.*

Gas storage tank. © Corbis.

The UK became a net importer of gas in December 2004 and is becoming increasingly reliant on imports. In late 2005, UK wholesale gas prices increased considerably, reaching over 140 pence per therm and further increases in early 2006 brought prices to over 200 pence per therm. The country's main storage facility in the Rough Field in the North Sea was closed due to fire in February 2006 and, combined with increased domestic demand during cold winter weather, there were serious concerns regarding supply.

## Preface

In January 2006 the Department of Trade and Industry published an energy review consultation document, *Our Energy Challenge*, to seek views on the UK medium- and long-term energy policy issues for consideration in the energy review. In the 2003 Energy White Paper it was stated that the policies would be reviewed and updated, if appropriate. Since then there has been more evidence of the adverse impact of climate change and fossil fuel prices have increased sharply. The UK is now a net importer of these fuels and there are concerns about the security of supply from major exporter countries. Progress has been made, but issues causing concern include projected CO<sub>2</sub> emissions by 2020 that are only slightly lower than current levels and greater reliance on oil and gas is anticipated. Maintaining reliable electricity supplies will require substantial new investment, and macroeconomic risks are presented by higher global energy prices. The review aims to consider energy supply and demand, investigate existing and new carbon technologies and the uptake of energy efficiency measures.

Nuclear generation provides around 20 per cent of the UK's electricity supply at present. The 2003 Energy White Paper concluded that replacement nuclear build was unattractive at that time but, with the recent increases in energy prices, this will be reconsidered in the review. The full report can be downloaded from the DTI website at [www.dti.gov.uk/energy/review](http://www.dti.gov.uk/energy/review).

During 2005, production of fuller's earth in the UK ceased as remaining permitted reserves are currently uneconomic and development is not planned. On a more positive note, gold production in Northern Ireland has commenced and advanced exploration continued as part of an on-going feasibility study. The first commercial exploration for nickel-copper in more than 30 years is taking place in Aberdeenshire and exploration continues at the Parys Mountain base metal deposit in North Wales.

In March 2006, a new five-year contract was signed between BGS and the Department for Communities and Local Government (DCLG) for a Joint Minerals Information Programme. This research project will undertake analysis in order to provide information and advice on minerals and selected broader geological issues to meet the requirements of DCLG and as a basis for monitoring and developing land-use policy and responding to national and European policy issues. The United Kingdom Minerals Yearbook is maintained under this programme and we are grateful to DCLG for their continuing support.

Brian Marker, Office of the Deputy Prime Minister (now DCLG), and David Highley, BGS, retired in 2006. Both made important contributions to the UK minerals industry over more than thirty years. They were strong supporters of this publication and David made substantial contributions both as an author and manager. I wish to thank them both for their dedication and support.

I also would like to thank colleagues in the Government statistical service who have collaborated so readily in providing the basic data included in this volume. In addition I would like to thank the many organisations, trade associations, companies and individuals who have generously supplied additional information.

David A Falvey, PhD

### Explanatory notes

**Coverage:** Except where otherwise stated all the statistics shown relate to the United Kingdom of Great Britain and Northern Ireland.

The Channel Islands and the Isle of Man are also included in the 'United Kingdom' overseas trade statistics, but are excluded from the production statistics. The UK part of the Continental Shelf is included in both the overseas trade and the production statistics.

All figures for the latest year shown are provisional and subject to revision.

**Rounding of figures:** In tables where figures have been rounded to the nearest final digit, there may be a slight discrepancy between the sums of the constituent items and the total as shown.

**Units:** The statistics in this volume are expressed in metric units. The following factors are given for converting from or into non-metric units:

Troy ounce	Kilogram
1	= 0.0311035
32.1507	= 1
Pound	Kilogram
1	= 0.453592
2.20462	= 1
Hundredweight	Kilogram
1	= 50.8023
0.019684	= 1
Long ton	Tonne
1	= 1.01605
0.984206	= 1
Square yard	Square metre
1	= 0.836127
1.19599	= 1

Cubic yard	Cubic metre
1	= 0.764555
1.30795	= 1
UK gallon	Litre
1	= 4.54596
0.2199755	= 1

**Symbols:** The following symbols are used throughout:

...	Figures not available
0	Quantity less than half the unit shown
—	Nil
nes	Not elsewhere specified
BGS	British Geological Survey

**Apparent consumption:** BGS estimates of apparent consumption of metals are based on the formula: production (primary and secondary) plus imports minus exports. All the main traded forms of the metal are taken into account, for example, ores, concentrates, intermediate products, unwrought metal and alloys, oxides, etc. Figures are given in terms of metal content. No information is available for stock changes. Such estimates of apparent consumption are made for metals for which there are no reported consumption statistics: in this edition data are given for chromium, cobalt, manganese, molybdenum, titanium and zirconium.

**Trade:** Trade figures from INTRASTAT, the new system for measuring intra-EC trade became available from 1993. This was introduced following the abolition of customs controls as a result of the Single Market and trade figures are now compiled from data provided directly from companies instead of Customs documents. Extra-EC trade continues to be collected from Customs declarations as before. The transition from one system to another has produced some anomalous figures in terms of the size of the trade in and unit value of certain commodities. These factors should be taken into consideration when evaluating trends. Figures given in this edition are the combined intra and extra-EC trade data.

Values of commodities are cif for imports and fob for exports.

The terms 'scrap', 'unwrought' and 'wrought' metal include alloys unless these are separately shown.

## Sources of information

In compiling this volume the British Geological Survey has largely relied upon data originally collected by other bodies. A list of the departments and organisations concerned is given below, together with the titles of principal publications that have been used. In many cases the BGS has also been provided with supplementary or unpublished information. Interested readers are strongly advised to consult the original sources themselves wherever possible and in this connection may wish to refer not only to the publications as listed here, but also earlier issues in the same series, some of which were published under different titles.

Information about the production of minerals in the United Kingdom is given from 1853 to 1881 in a series of Geological Survey Memoirs entitled *Mineral Statistics*, by Robert Hunt, Keeper of Mining Records; earlier information for certain metalliferous minerals is also available. Since 1873 all collieries and metalliferous mines have been required by statute to complete annual returns of production, and since 1895 the same has applied to quarries. These returns were made to the Home Office, which, in 1882, was made responsible for the publication of *Mineral Statistics*. In 1920 responsibility for collection of returns was transferred to the Mines Department (Board of Trade) and statistics were subsequently published in the Annual Reports of the Secretary of Mines. The Mines Department was incorporated into the Ministry of Fuel and Power in 1942 and statistics from 1938 to 1972 were published in their Statistical Digests (subsequently the Digests of Energy Statistics of the Department of Trade and Industry). In 1973 responsibility for the collection of returns relating to most minerals other than fuels was transferred to the Business Statistics Office (formerly part of the Department of Trade and Industry, now the Office for National Statistics). The Department of Trade and Industry, and previously the Department of Energy, collects statistics relating to hydrocarbons (natural gas and crude petroleum). Statistics on coal production are now collected by The Coal Authority. Returns of sand and gravel were collected by the Department of the Environment up to 1974. Details of mineral production in Northern Ireland since 1922 have been obtained by the Northern Ireland Government.

## Minerals in the national economy

The economic importance of individual industries, including the extractive industries, to the national economy is measured by their contribution of gross value added (GVA). The GVA of the minerals extractive industries as a whole is included in national accounts under the heading 'Mining and quarrying', which includes the extraction of oil and gas. The GVA for 'Mining and quarrying' was £29 849 million in 2004, or 2.9 per cent of national GVA. The extraction of oil and gas accounted for £27 449 million of the total for the extractive industries, the mining of coal £354 million, and other mining and quarrying £2046 million.

The estimated total value of minerals produced in 2004 in the UK, expressed as sales on an ex-works basis as opposed to gross valued added, was £25 204 million, a very small decrease on 2003.

UK: Value of mineral production, 2002–2004	£ million		
	2002	2003	2004
Oil and natural gas liquids	14 523	14 470	14 461
Natural gas	8 199	7 554	7 115
Coal	889	794	800
Aggregates	1 648	1 698	1 794
Other construction minerals	227	268	311
Industrial minerals	609	657	722
Metalliferous minerals	<0.2	<0.2	<0.2
<b>Total</b>	<b>26 095</b>	<b>25 441</b>	<b>25 204</b>

Production of crude oil, including natural gas liquids, declined by 11 per cent between 2004 and 2005 to 84.67 million tonnes. Cumulative production of oil to the end of 2004 was 3005 million tonnes and estimated total remaining reserves in present discoveries are in the range 533 to 1328 million tonnes. Natural gas production also declined from 96.01 million tonnes (oil equivalent) in 2004 to 87.97 million tonnes in 2005. The UK became a net importer of gas in 2004, after many years of self-sufficiency, and will become increasingly dependent on imports in the future as indigenous production continues to decline. Cumulative net natural gas production to end of 2004 was 1921 billion cubic metres and estimated remaining reserves in present discoveries are in the range 531 billion cubic metres and 1169 billion cubic metres.

Coal production declined by 17.8 per cent from 25.10 million tonnes in 2004 to 20.62 million tonnes in 2005. The largest decrease was in deep mine production due to mine closures. For the first time, opencast coal production exceeded that from deep mines. Coal imports also increased from 34.65 million tonnes in 2004 to a record 43.93 million tonnes in 2005.

### UK: Primary fuel consumption for total energy and use in electricity generation

	Million tonnes of oil equivalent			
	Total energy		Electricity generation	
	2003	2004	2003	2004
Coal	40.0	39.3	32.5	31.3
Petroleum	74.3	76.5	1.2	1.1
Natural gas	94.5	96.1	27.9	29.1
Nuclear	20.0	18.3	20.0	18.2
Hydroelectricity and wind, other renewables, waste	3.6	4.2	2.8	3.4
Net electricity imports	0.2	0.6	0.2	0.6
Other fuels	-	-	1.9	0.6
<b>Total</b>	<b>232.5</b>	<b>234.9</b>	<b>86.6</b>	<b>85.4</b>

Total UK production of primary aggregates increased from a total of 232.2 million tonnes in 2003 to 243.9 million tonnes in 2004. However, this is believed to principally reflect an improved coverage of sites rather than an increase in demand. Production in 2005 was similar to 2004. China clay sales have continued to decline from 1.95 million tonnes in 2004 to 1.8 million tonnes (estimated) in 2005, and ball clay sales have remained fairly constant at around 950 thousand tonnes. Over 80 per cent of sales of both minerals are exported. Production of fuller's earth ceased in 2005, bringing to an end a long-established industry which has been in operation since Roman times.

The first recorded gold production in Northern Ireland commenced from the Galantas Gold Corporation's Omagh (formerly Cavanacaw) gold mine. Production is currently at the rate of 150 tonnes per day at a head grade of between 11 and 20 grammes Au per tonne.

The EU Mining Waste Directive has been finalised and Member States are required to comply with this Directive by May 2008.

## **British Geological Survey**

The BGS and the Department for Community and Local Government (DCLG) have recently embarked on a new programme to continue work on collating UK and European mineral statistics, analysis of minerals intelligence, provision of information and advice, and raising public awareness of minerals-related issues. This work was previously carried out under the ODPM-BGS Joint Minerals Programme.

A report entitled *Summary of information on coal for land-use planning purposes* is being produced for the DCLG (Minerals and Waste Planning Division) under the Joint Minerals Programme. The report summarises coal production, trade, consumption and uses, gives information on licensing and reserves, planning permissions and safeguarding resources and brings together background information that was previously scattered. This report may be purchased from the BGS Shop or downloaded from the MineralsUK website.

The *Mineral Planning Factsheets* series has been extended to include onshore oil and gas, coal and coalbed methane, natural hydraulic limes, building and roofing stone, fireclay, brick clay, and construction aggregates, making twenty factsheets in total. Revisions have been made to the majority of factsheets to include information for the whole UK (previously they covered England only). These factsheets, funded by the DCLG-BGS Joint Minerals Information Programme, each provide an overview of a specific mineral, and although they are primarily intended to inform the land-use planning process, they contain a wealth of useful general information and statistics. To see an up-to-date list of commodities that have been covered and to download the factsheets, please visit our website ([www.mineralsUK.com](http://www.mineralsUK.com)), where you will find details under *Planning*.

Mineral Matters, a series of short leaflets commissioned by the former Office of the Deputy Prime Minister, provide a non-specialist audience with key information on a wide range of topical minerals issues. Four new leaflets have been added to the series: *An introduction to mineral planning; Minerals — Earth's natural resources; Mineral extraction and the water environment; and Future issues for sustainable mineral extraction*.

All the reports listed above, and many others, can be downloaded from our website, [www.mineralsUK.com](http://www.mineralsUK.com), which has recently been redesigned and improved to make information more accessible to users. The website is now the main portal for the *MineralsUK Centre for Sustainable Minerals Development* and continues to provide information on mineral resources, mineral planning, policy and legislation, sustainable development, statistics and exploration.

The British Geological Survey's on-going Baseline Survey of the Environment (G BASE) project has continued the regional geochemical mapping of mainland Britain to the north of London. By the end of 2005, sampling was complete as far south as an east–west line extending approximately from London to the Severn Estuary leaving just southern England to be sampled. This project involves the collection of stream sediments, waters and soils at an average sampling density of one sample every one to two square kilometres. Soils and sediments are analysed by XRF for up to 50 elements. Waters are analysed by ICP-MS/AES and other methods for 43 elements and selected ions. Data are stored in the BGS Geochemistry Database which currently has 455 000 samples registered, 60 per cent of these originate from G-BASE, 35 per cent from the old Mineral Reconnaissance Programme and five per cent from other sources. There are now nearly eight million analyte determinations stored in the database. The G BASE results are presented in the form of regional atlases of which 14 have been published to date; the analytical data are available for use under licence. Additionally in 2005 the G-BASE team has been involved in sampling soils and drainage samples in Northern Ireland as part of the Tellus project. The Tellus project is funded by the Northern Ireland Department of Enterprise, Trade and Investment (DETI) and involves both regional geophysical and geochemical mapping of Northern Ireland carried out by a team of scientists from the Geological Survey of Northern Ireland.

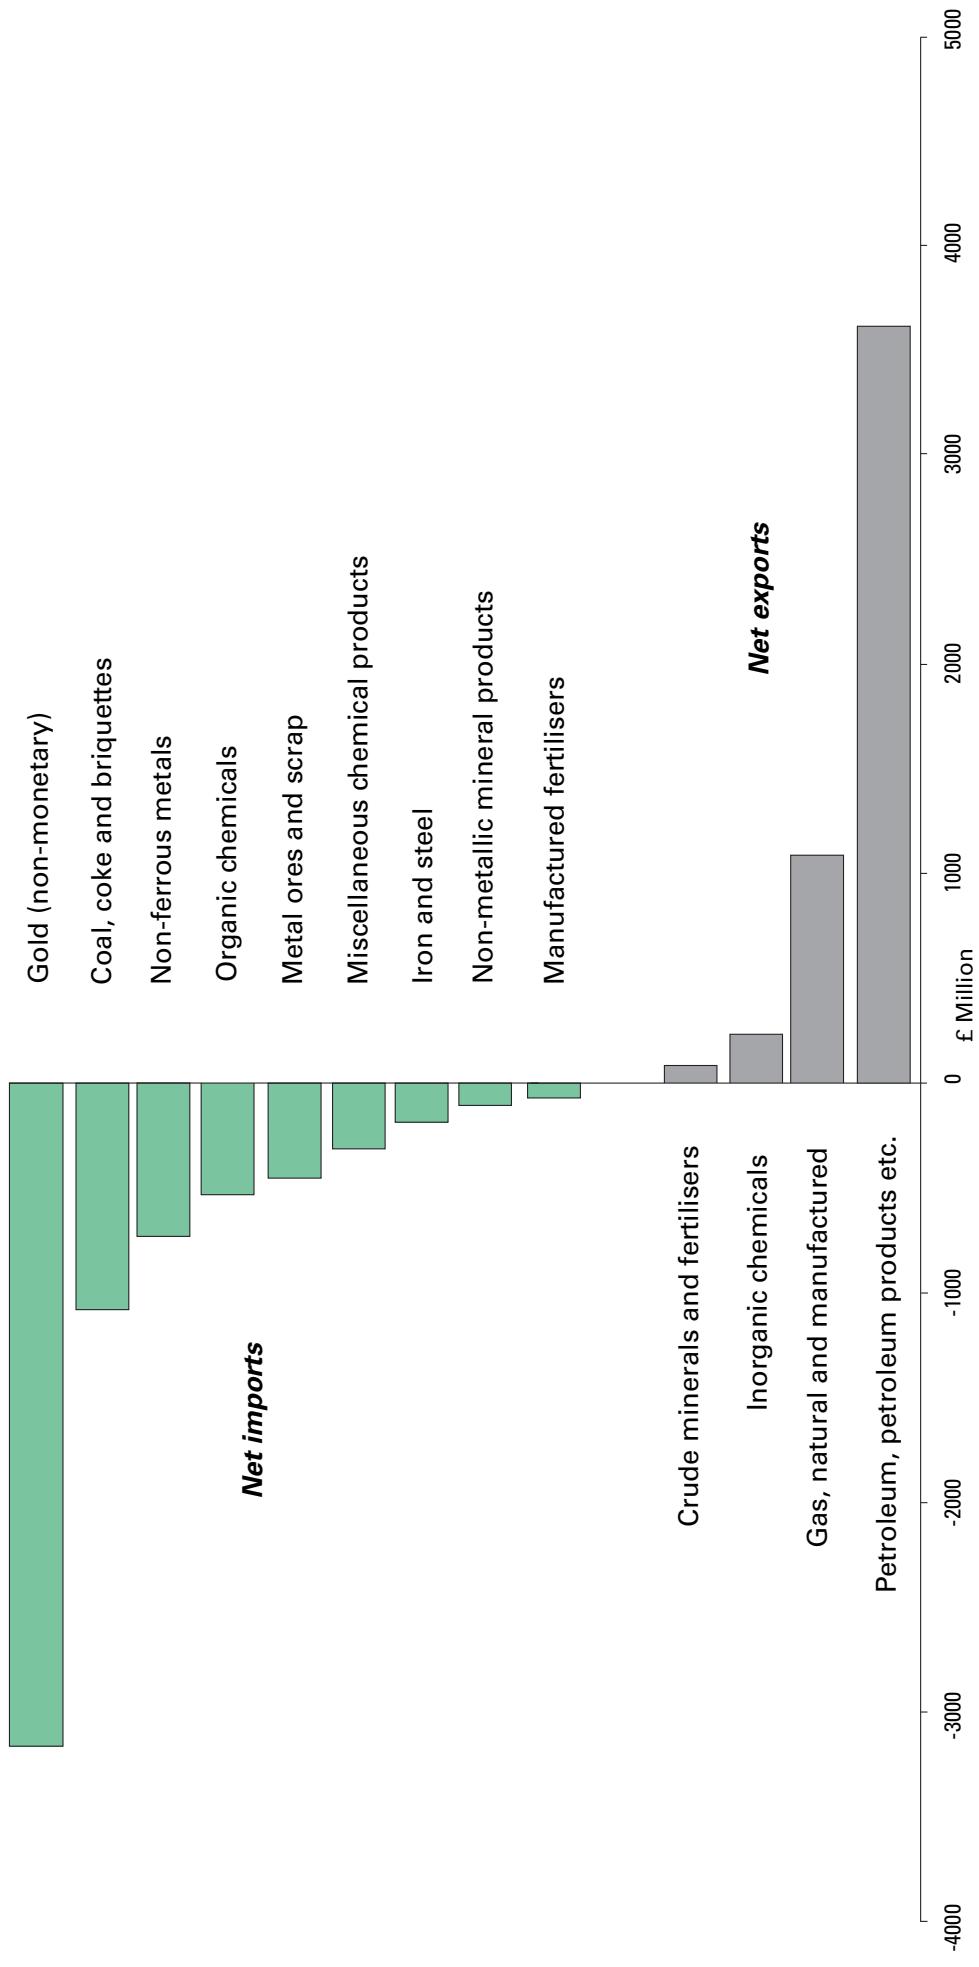

Dr John Ludden has been appointed the next Director of the British Geological Survey and will succeed Dr David Falvey, who retires in October 2006. Dr Ludden is currently based at the French National Centre for Scientific Research (CNRS), where he is Director of the CNRS Planète-Terre Directorate covering 55 laboratories across France in the fields of earth, ocean and atmospheric sciences. He is also a Director of Research at the CNRS.

## Trade in minerals and mineral-based products compared with total trade 1998–2004

Others	—	—	—	276
<b>Total</b>	<b>6 745</b>	<b>16 468</b>	<b>23 213</b>	<b>1 703</b>

(a) Where more than one mineral is extracted at a mine or quarry all employment is attributed to the chief mineral.

(b) Included with 'Others'.

(c) The United Kingdom Offshore Operators Association (UKOOA) estimates the workforce employed on the UK Continental Shelf at 260 000, with 33 000 directly employed by exploration and production companies. (This figure is not consistent with the series previously published in this book.)

(d) Including surface and underground workers at mines.

(a) Slurry etc. recovered from dumps, ponds, rivers etc.

(b) Marketable product (KCl).

(c) Including ethane, propane and butane, in addition to condensates.

(d) Dry weight.

(e) Excluding a small production in Northern Ireland.

(f) BGS estimates based on data from producing companies.

(g) Slate figures include waste used for constructional fill and powder and granules used in industry.

(h) BGS estimate.

(i) Including marine-dredged landings at foreign ports (exports); see p.87.

(j) Excluding a small production of granite in Northern Ireland.

(k) In addition, the following amounts of igneous rock were produced in Guernsey (thousand tonnes): 1999: 139; 2000: 130; 2001: 134; 2002: 138; 2003: 142, 2004: 149 and Jersey: 1999: 370; 2000: 310; 2001: 365; 2002: 370; 2003: 290; 2004: 310.

(l) Used for purposes other than salt making.

Sources: Office for National Statistics, Department of Trade and Industry, Dept. of Enterprise, Trade & Investment (Northern Ireland), Crown Estate Commissioners (marine sand and gravel produced for export), and company data.

(a) Ball clay included as a separate mineral for the first time in 2000, previously under 'clay/shale'.

(b) Coalbed methane added in to this category for the first time in 2000. In 1994, oil/gas were split into 'exploration/appraisal' and 'production' categories, but were combined in 2000.

(c) Slate was only a separate mineral category in 2000.

(d) Based on published 1994 data.

(e) Estimate, taking into account older permissions for which accurate information was not available in 1994.

Source: *Survey of Land for Mineral Workings in England 2000*, Department for Transport, Local Government and the Regions.

(a) The typical value ranges are designed to provide information about general levels of value passing in the market in each region. They do not represent the extremes either high or low. The ranges are of necessity very broad as they encompass a wide range of categories contained under each class. They should not be relied upon as indications of specific value.

(b) At 1 October 2002

(c) At 1 October 2003

(d) At July 2004

## Aggregates

Sales of primary aggregates (sand and gravel, and crushed rock) in Great Britain were reported as 213.7 million tonnes in 2004, according to the official Annual Minerals Raised Inquiry (AMRI) carried out by the Office for National Statistics. This appears to show a significant increase on the 2003 AMRI survey (203.1 million tonnes) but actually reflects improved coverage of operational quarries reporting rather than an improvement in sales.

Of total sales in 2004, 60 per cent comprised crushed rock aggregates, 34 per cent was land-won sand and gravel and six per cent marine-dredged sand and gravel. The Quarry Products Association (QPA) estimate that primary aggregate sales have declined slightly in 2005, with crushed rock sales down by three per cent to 124 million tonnes and sand and gravel sales down two per cent to 84 million tonnes. Approximately one quarter of the UK requirement for aggregates is met from recycled or secondary sources.

In his budget statement of March 2006, the Chancellor maintained the Aggregate Levy at a rate of £1.60 per tonne for primary aggregates. The British Aggregates Association (BAA) has continued its opposition to the Aggregates Levy by taking a case to the European Court of First Instance in Luxembourg in December 2005. Their case is based on the claim that by exempting certain materials from the levy the UK Government are in effect giving an illegal state subsidy to those industries. The decision of the court is expected during 2006 but legal advisors to the BAA have urged quarry companies to submit precautionary claims for repayment of the Aggregates Levy.

Aggregate Industries, now owned by the Holcim Group of Switzerland, have seen their market share increase further, according to the latest report from BDS Marketing & Research. They are now in third place in the UK aggregates market with 12 per cent (up from 11 per cent). Tarmac remains the leading aggregate producer with 22 per cent (the same as last year), with Hanson in second position at 14 per cent (down from 15 per cent). Cemex, following their acquisition of the RMC Group in March 2005, are in fourth place with 11 per cent and Lafarge Aggregates fifth with just over eight per cent. Together these top five producers represent nearly 70 per cent of the aggregates market.

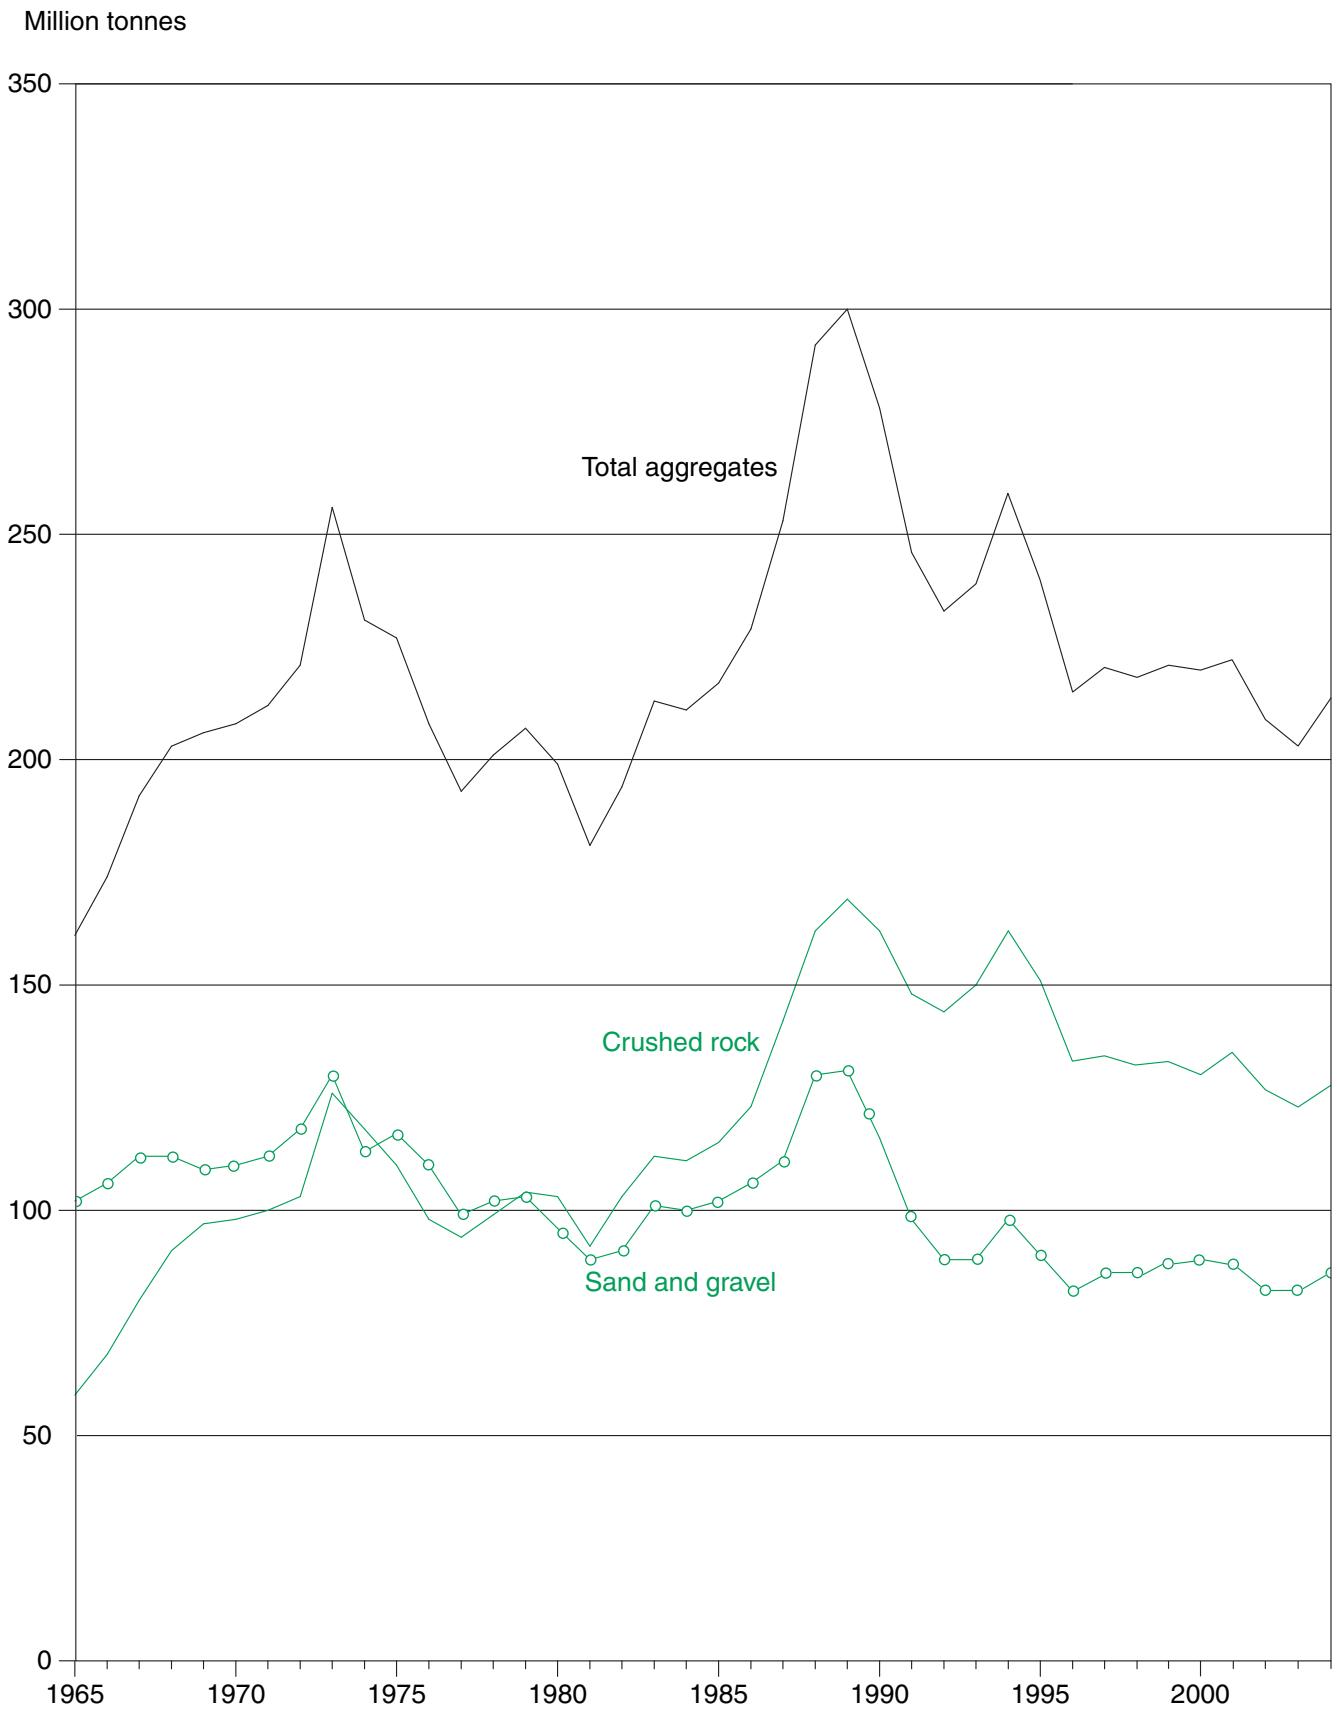

Demand for asphalt in 2005 increased by approximately five per cent on the previous year, but this increase is not expected to continue into 2006. Tarmac continue to be the largest asphalt supplier with around 30 per cent market share, with Aggregate Industries consolidating their position in second. Hanson, Cemex and Lafarge complete the top five companies, which have a combined total of 80 per cent of the market.

Sales to the readymix concrete market in 2005 remained similar to 2004, despite a promising increase during the first half of the year. Sales in 2006 are not expected to increase, but the construction projects planned in preparation for the London Olympics in 2012 should raise demand from 2007. Cemex remain the largest supplier in 2005, according to BDS Marketing & Research, but with both Tarmac and Hanson increasing their market share this long-standing lead is being eroded. The combined market share of these top three companies is more than 60 per cent.

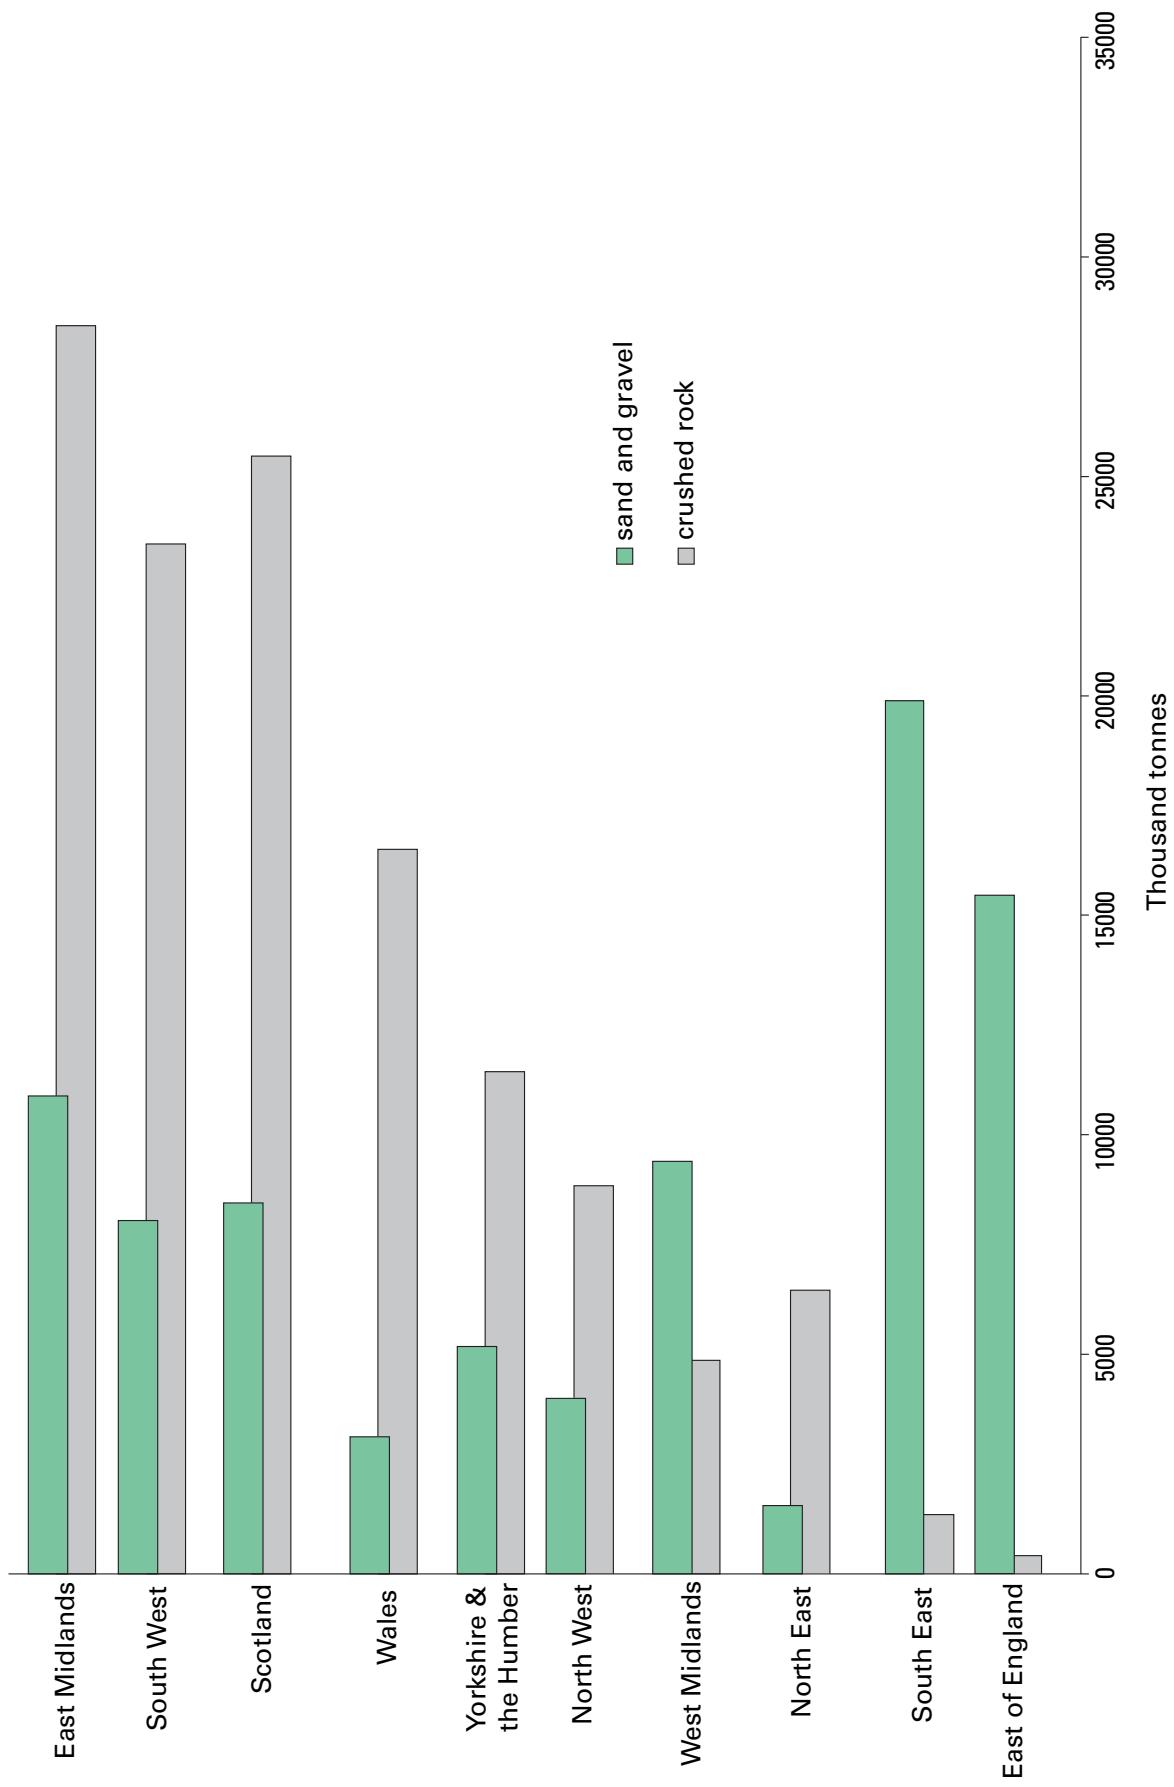

The Peak District National Park Authority issued a stop notice in January 2006 to halt extraction of limestone at Backdale Quarry. It is alleged that the scale of extraction of limestone at the site is illegal under a 1952 planning permission, which was issued for the extraction of 'fluorspar, barites, lead and any other minerals won in the course of working those minerals'. This issue will go to a public inquiry in April 2006.

Recent research has shown that permitted aggregate reserves have declined since 2000 because the quantities involved in new planning permissions have remained less than the actual tonnes extracted. BDS Marketing & Research Ltd estimate that in some years the additional reserves receiving planning permission represent less than one-third of the total aggregates extracted. This raises concerns relating to the ability of the industry to meet future demand.

### Great Britain production of natural aggregates 1965–2004

**Great Britain production of crushed rock aggregate and sand and gravel by region 2004**

## England and Wales summary of consumption of primary aggregates, by region 2001 (a)

Thousand tonnes

Region	Land-won sand and gravel	Marine sand and gravel	Total sand and gravel	Crushed rock	Total primary aggregate
South West	5 604	659	6 263	19 140	25 404

(a) Including dolomite.

(d) BGS estimate.

(b) Total production, excluding marine-dredged material for export;  
see table on p.93.

Source: Office for National Statistics.

(c) The following amounts of crushed rock aggregate, believed to be mainly igneous rock, were exported (million tonnes): 1999: 3; 2000: 2; 2001: 3; 2002: 4; 2003: 3; 2004: 4. Crushed rock aggregate is also imported in comparable amounts. These figures have not been taken into account when calculating consumption.

**Great Britain consumption of natural aggregates related to construction work  
(intensity of use of aggregates) 1955–2004**

- (a) Including production from marine dredging  
 (b) Great Britain only  
 (c) For a number of years, a significant amount of crushed rock imports are believed to have been wrongly classified as granite, crude'. In 2004, BGS estimates that 'crushed rock imports should be approximately 1 500 000 tonnes which includes armourstone.  
 (d) Principally marine-dredged sand and gravel. Source: HM Customs and Excise. However, the Crown Estate Commissioners give the following figures for marine-dredged sand and gravel landed at foreign parts (tonnes): 2000: 7 314; 2001: 6 992 731; 2002: 6 190 905; 2003: 6 095 640; 2004: 6 191 867

# Ball clay

Ball clays are fine-grained, highly plastic sedimentary clays, which fire to a light or near white colour. They are used mainly in the manufacture of ceramic whiteware (sanitaryware, floor and wall tiles, and tableware) and also refractories, and are valued for their key properties of plasticity, which makes them easy to mould, their unfired strength and the fact that when fired they have a light colour. Ball clays exhibit highly variable compositions and consist of a mixture of predominantly three minerals; kaolinite, mica and quartz. The clay mineral kaolinite is the key component.

Ball clay sales were a record 1 068 654 tonnes in 2000, but have been on a gradual decline since and were an estimated 950 000 tonnes in 2005. The UK is a leading world producer and exporter of high quality ball clay. In 2004, 805 359 tonnes (83 per cent) of sales were destined for export, including 634 836 tonnes to the EU.

Ball clay has a restricted occurrence in the UK and resources are confined to three small areas all in the south-west region of England: the Bovey and Petrockstowe basins in Devon and the Wareham Basin in Dorset. The Bovey Basin is the most important, both in terms of total sales (68 per cent in 2004) and, more importantly, the diversity and quality of the clays that are produced. The Wareham and Petrockstowe basins accounted for 19 per cent and 13 per cent of total sales, respectively in 2004.

The two UK producers of ball clay are WBB Minerals the world's leading producer of high-quality ball clays, and Imerys Minerals Ltd. WBB is a wholly-owned subsidiary of SCR Sibelco SA, a privately-owned Belgian mineral company, and operates solely in Devon. Imerys Minerals is a subsidiary of the Imerys Group of France and has had workings in all three basins. However, the company ceased production in the Petrockstowe Basin at the end of 2004, because of the high costs of extraction.

## Barytes

Barytes (barium sulphate, BaSO<sub>4</sub>), also referred to as barite or baryte, is the most abundant and economically important barium mineral produced worldwide. When pure, barytes contains 58.8 per cent barium and 41.2 per cent sulphate and with a specific gravity (SG) of 4.5 it is often referred to as 'heavy spar.' Inclusions of other minerals may reduce (or in the case of metallics increase) the SG, but a high density, chemical inertness, relative softness and relatively widespread occurrence are the properties that are valued for barytes' most important application as a weighting agent in drilling fluids for hydrocarbon exploration. Colour and chemical purity are important properties when considering the suitability of barytes for non-drilling applications.

UK sales of barytes have been relatively constant in recent years and were an estimated 61 000 tonnes in 2005. Output is dominated by M-I Drilling Fluids UK from its Foss Mine, near Aberfeldy in Scotland, which accounted for more than 80 per cent of total production in 2005. The output is mainly used in drilling fluids, although some is sold for use as a heavy aggregate in dense concrete to provide radiation shielding. Remaining production is confined to the Southern Pennine Orefield where barytes is derived as by-product of processing fluorspar ore at Glebe Mines' Cavendish Mill, near Stoney Middleton in the Peak District. Output is essentially dependent on fluorspar output and on the barytes content of the fluorspar ore, which depends on the deposit being worked. Production was approximately 12 000 tonnes in 2004. The barytes flotation concentrate is sold locally to Viaton Industries for value-added processing by fine grinding for filler applications in paints and plastics. Some is also used in oil-well drilling fluids.

Britain is a net importer of barytes and imports for 2004 were some 63 934 tonnes valued at £2.7 million. Imported barytes is mainly used as a weighting agent in drilling fluids for offshore oil and gas exploration. Official figures for barytes exports are believed to be too high and were 25 360 tonnes in 2004.

# Bricks

Total deliveries of clay bricks decreased from 2668 million bricks in 2004 to 2419 million bricks in 2005 and actual production decreased slightly from 2707 million bricks in 2004 to 2601 million bricks in 2005. Clay brick stocks were 776 million in 2005 up slightly on 600 million in 2004. Marshalls Plc, the landscape and stone products group, sold its clay brick business to Hanson Plc at the end of 2004 for £65 million. Marshalls Clay Products was the fifth largest brick manufacturer in the UK, producing around 160 million brick equivalents a year and in the year ending 2004. In 2004, Hanson Brick also purchased Wilnecote Brick from Tarmac for an undisclosed sum. Wilnecote Brick operates one modern plant at Tamworth in Staffordshire with a capacity of about 35 million bricks per year. The plant is based on mudstones of the Etruria Formation, the premium brick clay produced in Britain. The acquisition now makes Hanson Brick the leading UK brick manufacturer with Ibstock Brick the second largest.

The Austrian group Wienerberger, the world's leading brick producer, acquired 'The brickbusiness' for about £90 million, in early 2005. The brickbusiness was formed in 2002 by the merger of Ambion Brick and Chelwood Brick and is the UK's third largest brick producer with nine works and sales of £64 million in 2003/4. It accounted for about 17 per cent of UK brick sales. Great Britain is by far the largest European market for facing bricks.

## Chalk (see Limestone)

## China clay

China clay or kaolin is a commercial clay composed principally of the hydrated aluminosilicate clay mineral kaolinite. The commercial value of china clay is based on the mineral's natural whiteness and its fine, but controllable, particle size. Particle size affects fluidity, strength, plasticity, colour, abrasiveness and ease of dispersion. Other important properties include its flat particle shape, which increases opacity or hiding power, its soft and non-abrasive texture, due to the absence of coarser impurities, and its chemical inertness. These key properties distinguish china clay from the other kaolinitic clays produced in Britain, such as ball clay and fireclay. The kaolinite content of processed kaolin varies, but is generally in the range 75 per cent to 94 per cent. China clay is mainly used in papermaking as a coating pigment and filler, although the ceramics industry, and its use as a filler in paint, rubber and plastics are also important markets.

China clay resources in Britain are confined to the granites of south-west England. The deposits are world famous for their size and quality and have provided over 165 million tonnes of china clay since production records began in the late 19th century. All the main granite intrusions have been worked to a limited extent in the past. Today production is confined to the St Austell Granite and the south-western margin of the Dartmoor Granite, and on the adjacent but separate Crownhill Down Granite. Production from the Bodmin Moor Granite ceased in 2001 with the closure of the Stannon Pit. The St Austell Granite is by far the most important source accounting for about 85 per cent of total sales. The industry is of considerable national and regional importance.

China clay sales have been on a declining trend since peak output of 3.28 million dry tonnes in 1988. Sales declined from 1 945 000 dry tonnes in 2004 to an estimated 1 800 000 dry tonnes in 2005. In 2004 88 per cent of UK china clay production was exported, mainly to Europe.

The extraction and processing of china clay involves the production of very large quantities of waste. China clay waste is exempt from the Aggregates Levy and sales for aggregate use have increased from 2.1 million tonnes in 2001 to 2.5 million tonnes in 2004. Sales are mainly in the south-west, although small quantities are also shipped to London and the south-east. However, shipments of china clay aggregate from the Port of Par declined from 160 000 tonnes in 2003 to 62 000 tonnes in 2004. This is due to the rising cost of sea freight, the cost of fuel and the lack of available vessels. Plans for a significant expansion in shipments are unlikely to materialise in the short term.

Imerys Minerals Ltd is the largest china clay producer accounting for about 85 per cent of total output with operations based on the St Austell Granite in Cornwall and the south-western margin of the Dartmoor Granite in Devon. The company is a subsidiary of the Imerys Group of France, which is the world's leading kaolin producer. Goonvean Ltd, a privately-owned company, operates five quarries in the St Austell Granite and WBB Minerals operates two sites on the Dartmoor Granite and Crownhill Down Granite.

## Coal (also see Primary fuels)

In 2005, coal production fell to 20.6 million tonnes, a decrease of 4.5 million tonnes (17.8 per cent) compared with the previous year. This was due to closure and mothballing of deep mines and planning permission constraints for opencast extraction. Of the total production, underground mines contributed 9.6 million tonnes (46 per cent) and opencast mines 10.4 million tonnes (51 per cent) with minor quantities recovered from other sources. For the first time, opencast production exceeded that of deep mines. The value of coal production is estimated to have stayed fairly level at £800 million in 2004 compared to £794 million in 2003. The number of people employed in UK collieries at the end of March 2005 was 4599, and in opencast sites, 2234.

Coal consumption increased from 60.7 million tonnes in 2004 to 62.2 million tonnes in 2005. In 2005, generation of electricity used 52.2 million tonnes, or 83.9 per cent of total consumption. Coal accounted for 40.8 per cent of total electricity generation in 2005, whereas gas accounted for 32.7 per cent. Consumption in coke ovens and blast furnaces accounted for 10.6 per cent and industrial, domestic and other uses for 5.5 per cent. Total stocks of coal at the end of 2005 were 15.5 million tonnes, an increase of 1.9 million tonnes compared to the previous year.

In 2004 imports were largely bituminous coal, with steam coal comprising 81.9 per cent of the total and coking coal 17.6 per cent. Anthracite accounted for only 0.5 per cent of imports. The sources of supply are summarised in the table below. The chief sources of steam coal were South Africa (34 per cent) and Russia (33 per cent) and the chief source of coking coal was Australia (65 per cent). Coal imports increased by 21 per cent from 36.2 million tonnes in 2004 to 43.8 million tonnes in 2005 and are now more than double the domestic production. In 2005 net imports were 69.5 per cent of total consumption.

Coal Authority licences for opencast sites in production 1 February 2006 totalled 41, of which 26 were in Scotland, seven in England and eight in Wales. This is the same number recorded at the end of 2004 but with an increase of three in Scotland and two in Wales. Scottish Coal held the largest number of licences with 14, all in Scotland. This is a significant increase on the ten licences they held in the previous year. Aardvark TMC Ltd, Celtic Energy Ltd and H J Banks & Company Ltd each held four licences. There were 16 operators in total.

Of the seventeen licences for underground mining, seven were held by UK Coal plc operating in the Midlands and Yorkshire. Each of the other ten licensees held one licence.

UK Coal plc showed a loss of £62.2 million in 2005, largely related to the closure of Ellington Colliery in January 2005 and the mothballing of Harworth and Rossington collieries, although there was a return to profitability in the final quarter of the year. Deep mine production fell by three million tonnes to nine million tonnes in 2005, reflecting the closure of the Selby complex in 2004. The estimated reserve of deep mine coal is 64 million tonnes, with a further 209 million tonnes in the resources categories.

Following the completion of coal extraction at Orgreave in January 2006, UK Coal plc is operating one surface mine, Maiden's Hall, Northumberland. Thirty-three other sites are being restored and rehabilitated at a cost of £10.8 million during 2005. Surface mine production fell to one million tonnes, from two million tonnes in 2004, due to the constraints of the existing planning permissions. During 2005 and early 2006, however, surface mine planning consent was granted for two mines, totalling 1.2 million tonnes. Surface mining showed an operating profit of £0.8 million. At the end of 2005, UK Coal plc surface mining reserves with planning consent were 2.7 million tonnes. Applications to mine at four sites were submitted during 2005 and applications to mine at another six sites will be lodged during 2006.

Permitted reserves of opencast coal in operational sites and those with planning permission but not yet worked at the end of 2005 are shown in the table below.

## Fluorspar

Fluorspar is the commercial term for the mineral fluorite (calcium fluoride, CaF<sub>2</sub>), which is the most important, and only UK source of the element fluorine (F). All UK output is of acid-grade fluorspar (>97 per cent, CaF<sub>2</sub>), and most is used in the production of hydrofluoric acid (HF), the starting point for the manufacture of a wide range of fluorine-bearing chemicals. Sales of acid-grade fluorspar were some 60 980 tonnes in 2005, up from 50 080 tonnes in 2004, and almost all the ore was derived from the Southern Pennine Orefield in the Peak District National Park.

Trade data for fluorspar make a distinction between fluorspar containing more than and less than 97 per cent CaF<sub>2</sub>. The former corresponds to acid-grade fluorspar. Imports of acid-grade fluorspar in 2004 were 19 295 tonnes valued at £2 million which was mostly derived from Spain.

Glebe Mines Ltd, a privately-owned company, is the sole producer of marketable fluorspar product in the UK. The company operates the Cavendish Mill, near Stoney Middleton for the supply of acid-grade fluorspar, together with by-product barytes, lead concentrate and limestone aggregate. The Cavendish Mill is the second-most important source of barytes in the UK and the only source of galena (lead sulphide). Production of lead concentrate (65% lead) was 800 tonnes in 2005. Fluorspar ore, with associated barytes and galena, is obtained mainly from the company's own open pit operations on Longstone Edge and elsewhere. The Watersaw Mine, also on Longstone Edge, continued to supply small amounts of ore during 2005. A review of the feasibility of reopening the company's Milldam Mine at Great Hucklow, which is currently on a care-and-maintenance basis, is being undertaken as part of an overall underground mine development plan. Reprocessing of historic tailings and supplies from local tributaries also make a significant contribution to company's ore requirement, which is about 400 000 tonnes per year. As individual deposits are relatively small, a continuous exploration programme is required to identify new deposits and process them through the planning system.

Acid-grade fluorspar is a critical raw material for the UK fluorochemicals industry. Most UK output (95 per cent) has been used by two companies — Ineos Fluor at Runcorn and Rhodia at Avonmouth — for the manufacture of hydrofluoric acid (HF). Rhodia closed its anhydrous HF plant at Avonmouth in October 2004. However, the company will continue the manufacture of fluorochemicals at Avonmouth and HF will need to be sourced from other suppliers, including Ineos Fluor.

HF is an important product in its own right and, for example, is used in the manufacture of high-octane petrol. However, it is also the key intermediate for the manufacture of all specialty fluorine-bearing chemicals, notably fluorocarbons. Demand for fluorspar in the UK is, therefore, principally driven by demand for HF and associated fluorochemicals production. Fluorine chemicals have many uses, including in refrigeration and air-conditioning systems, as foam blowing agents, non-stick coatings, aerosols, including medical propellants, anaesthetics, in pharmaceutical products and for specialised cleaning applications.

## Fuller's earth

Fuller's earth is a sedimentary clay that contains a high proportion of clay minerals of the smectite group, the most important of which is montmorillonite. Smectite clay minerals exhibit a unique combination of properties, including a high 'cation-exchange capacity'. This means that calcium-smectite, the principal constituent of British fuller's earths, can be readily converted to sodium-smectite by a simple process involving the addition of small amounts of sodium carbonate. It is commercial practice in Britain to refer to this sodium-exchanged clay as bentonite, which exhibits markedly different properties to calcium-smectite.

UK sales of fuller's earth, most of which are in the sodium-exchanged form (bentonite), were 26 000 dry tonnes in 2004 and 6200 dry tonnes in 2005 when production finally ceased, bringing to an end this long established minerals industry. UK imports of bentonite in 2005 were 155 832 tonnes valued at £10.6 million.

Fuller's earth was formerly produced by two companies in the UK: Rockwood Absorbents (Baulking) Ltd and Steetley Bentonite and Absorbents Ltd. Rockwood Absorbents (Baulking) Ltd produces fuller's earth at Baulking in Oxfordshire. The clay was processed on site, mainly for conversion into bentonite for use as a filler and fibre retention aid in papermaking and as a bonding agent for foundry sand. The original Baulking quarry was exhausted in summer 2002 and is now restored. Until the closure of the Baulking plant in October 2005, sales were based on stockpiles of crude fuller's earth, both from Baulking and the company's former operation at Clophill in Bedfordshire. Remaining permitted reserves of fuller's earth in the Baulking area are confined to a small satellite deposit at Moor Mill Farm, about 2 km from the plant at Baulking. The deposit contains reserves of some 300 000 dry tonnes and was granted planning permission in 1998 and was to have been opened up in 2004. However, a significant deterioration in the market for fuller's earth has rendered such a small deposit uneconomic and no working will now take place.

Steetley Bentonite and Absorbents Ltd, a wholly-owned subsidiary of Tolsa SA of Spain, formerly produced fuller's earth near Woburn in Bedfordshire. A planning application to extract fuller's earth from a southern extension to the deposit (Wavendon Heath South) was turned down in early 2001. The application was the subject of a public inquiry in September 2001 but the appeal was dismissed by the former ODPM in July 2002. A challenge to this decision was made in the High Court in February 2003 but was also dismissed. Consequently fuller's earth extraction ceased at Woburn in December 2004 with the exhaustion of the remaining reserves and marking the end of a long history of fuller's earth working in the area where it is thought to have been extracted as early as Roman times. Large-scale extraction in the Woburn area by F W Berk Ltd (acquired by the Steetley Co Ltd in 1970) started in 1951 and continued, with a small break between 1954 and 1957, until 2004. The current workings in Aspley Wood started in 1961 and have continued with a series of extensions to the original permission. The Wavendon Heath South site, covering some 54 hectares and containing some 320 000 tonnes of dry product, sufficient for about ten years output, would have been the last site in the area. In recent years fuller's earth from Woburn has been used almost entirely as a filler and fibre retention aid in papermaking.

# Gold

Mines Royal (gold and silver) exploration and development in Britain requires a licence from the Crown Estate Mineral Agent. The numbers of licences increased in 2005 from eight to 11, all in Northern Ireland, while leases remained steady at six (see map). There are also three new licences pending in Scotland. This reflected the steady rise in the gold price during the year, reaching \$540 per ounce, before rising further into 2006. The Crown Estate has reviewed its policy on Mines Royal licensing procedures and is prepared to accept applications for licences and leases from bona fide applicants. There has been little activity in Great Britain, apart from small-scale exploration in the Dolgellau area and initial investigations in Scotland. However, in Northern Ireland drilling and other activities have been undertaken in the Omagh and Armagh areas, and one of the deposits has commenced small-scale production. Mines Royal licence and lease activity is distributed throughout the United Kingdom as follows:

	Licences		Leases	
	Granted	Pending	Granted	Pending
England				
Northern Ireland	11		1	
Scotland		3	1	
Wales	2		4	
<b>Total</b>	<b>13</b>	<b>3</b>	<b>6</b>	

*Source: Crown Mineral Agent*

The 13 Mines Royal licences are held by the following companies:

Northern Ireland	Conroy Diamonds and Gold plc Omagh Minerals Ltd Ulster Minerals Ltd (wholly owned subsidiary of Tournigan Gold Corporation) Dalradian Gold Ltd (wholly owned subsidiary of Tournigan Gold Corporation)
Wales	Cambrian Goldfields Ltd

The three pending licences are all to Aurum Mineral Resources Ltd and are expected to be completed shortly and are included on the map of licences and leases.

The six Mines Royal leases and their current status are as follows:

Company	Country	Activity
Anglesey Mining plc	Wales	Dormant – potential underground Zn-Cu-Pb-Ag-Au mine at Parys Mountain
Anglo Canadian Exploration	Wales	Dormant – part of Anglesey Mining plc (Dolaucothi Mine)
Caledonia Mining Corporation	Scotland	Dormant – potential underground Au-Ag mine at the Cononish deposit, near Tyndrum, Scotland
National Trust	Wales	Visitor and Educational Centre at Dolaucothi Mine
Omagh Minerals Ltd	Northern Ireland	Open-pit gold mining at Cavanacaw deposit
Stoic Mining	Wales	Small-scale exploration

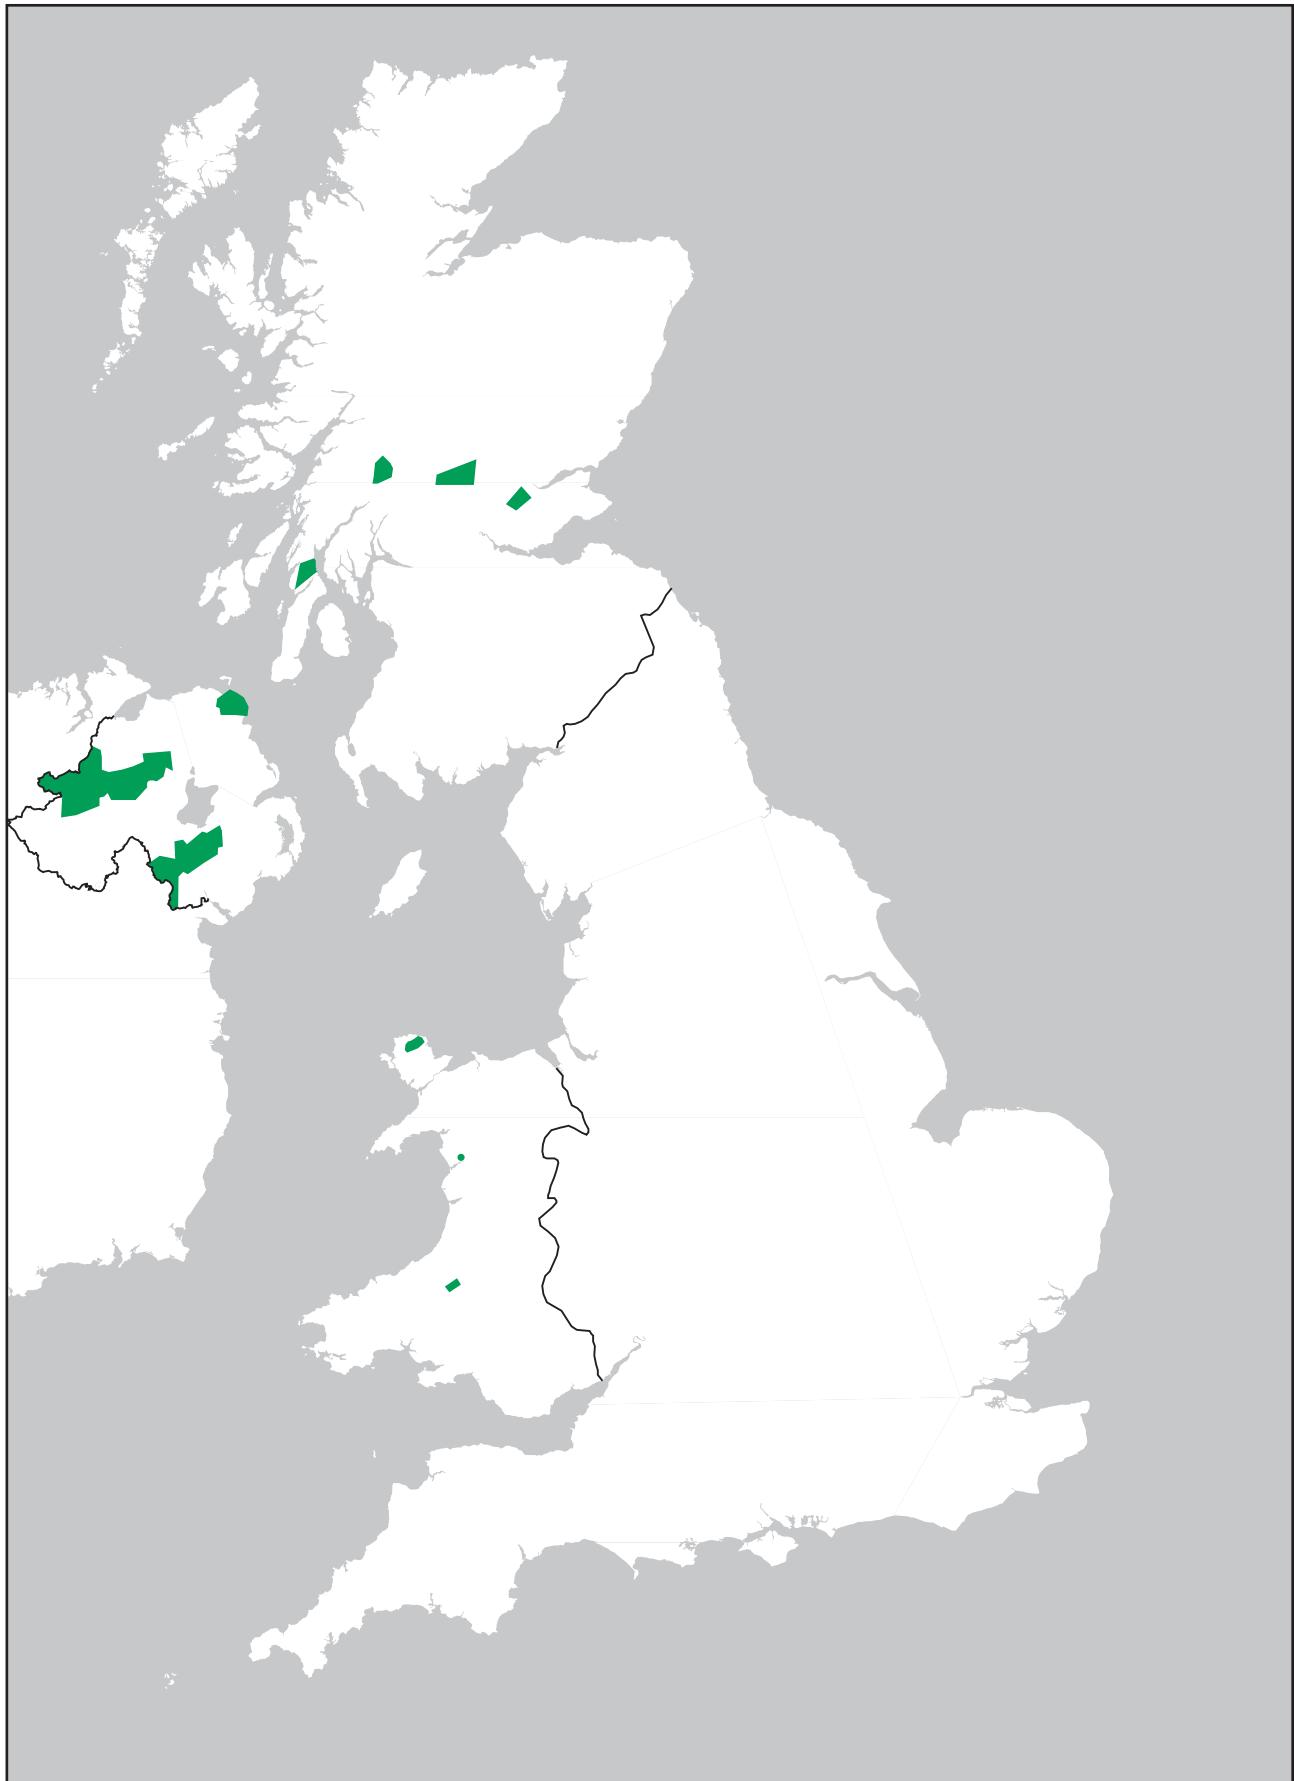

*Source: Crown Mineral Agent*

Tournigan Gold Corporation have continued their exploration effort at the Curraghinalt deposit 15 km north-east of Omagh in Co. Tyrone. This is a mesothermal quartz-vein hosted deposit with an inferred resource of 527 700 tonnes at 15.45 grams per tonne gold for a total of 262 018 ounces of gold. Additional underground development is planned as part of the on-going feasibility studies. So far only an 800 metre strike length of the vein system has been tested by drilling and underground exploration.

The Cavanacaw deposit, 10 km south-west of Omagh, is owned by Omagh Minerals, a wholly owned subsidiary of Galantas Gold Corporation. Construction is now on schedule for gold production from a small-scale open-pit mine in the spring of 2006 at a rate of 150 tonnes per day with a head grade of between 11 and 20 grams per tonne. The company also carried out a helicopter-borne VTEM survey which located a number of conductors for further investigation. Some of the gold is being marketed through the company's Galantas brand jewellery.

Conroy Diamonds and Gold continue to explore the 'Armagh–Monaghan Gold Belt' in the Longford–Down Massif which extends between Northern Ireland and the Republic of Ireland. The company now controls three licences totalling 750 km<sup>2</sup> in Northern Ireland. Follow-up sampling confirmed the presence of a gold-bearing structure at the Tivnacree prospect in County Armagh.

## Mines Royal Licences and Leases in 2004

As Crown Estate licences for gold and silver exploration are surrendered, the reports on the work carried out are deposited by the Crown Mineral Agent with the British Geological Survey for archive within the National Geoscience Records Centre. Thirty-four reports are now held, some of which are available for public access. Others will become available as the term of confidentiality expires.

## Gypsum

Gypsum ( $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ ) and anhydrite ( $\text{CaSO}_4$ ) are, respectively, the hydrated and anhydrous forms of calcium sulphate. Gypsum is economically the more important. In nature they occur as beds or nodular masses up to a few metres thick. Gypsum is formed by the hydration of anhydrite at or near surface, but passes into anhydrite at depth.

Calcium sulphate is also derived as a synthetic by-product of certain industrial processes. The most important is flue gas desulphurisation (FGD), a process that removes sulphur dioxide from the flue gases at coal-fired power stations. The product, known as desulphogypsum, is now an important supplement to the supply of natural gypsum, both in the UK and elsewhere.

UK consumption of gypsum is derived from three sources: the production of natural gypsum, mainly by underground mining, but with some surface extraction in Nottinghamshire; recovery of synthetic gypsum; and imports of both natural and synthetic gypsum. Natural gypsum, of which British Gypsum Ltd is the sole producer, is extracted in Leicestershire, Nottinghamshire, Staffordshire, Cumbria and East Sussex. Extraction is mainly by underground mining. BPB Plc, which owns British Gypsum and is the world's largest producer of gypsum building products, accepted a takeover offer from the French company Saint-Gobain in November 2005.

Total gypsum output was 1686 thousand tonnes in 2004. Official figures for imports of gypsum are difficult to interpret. In 2004 imports of crude gypsum were reported to be 64 043 tonnes valued at £8.2 million, whilst imports of calcined gypsum, i.e. plasters, were 163 025 tonnes valued at £8.8 million. It is likely that some imports of crude gypsum are being wrongly classified as plaster.

Desulphogypsum produced by the neutralisation of sulphur dioxide contained in flue gases at coal-fired power stations, is currently produced at five sites in Britain. Their output of desulphogypsum is shown in the table.

The FGD plant at the 2000 MW West Burton power station in Nottinghamshire, which is owned by EDF Energy, came on stream in December 2003. The new plant produced 274 000 tonnes of desulphogypsum in 2004 of which 225 000 tonnes was sold for plasterboard manufacture. FGD capacity has also been fitted to two of the four units at the Eggborough 2000 MW station in North Yorkshire and FGD plant has been retrofitted to EDF Energy's 2000 MW Cottam station in Nottinghamshire; these were commissioned in 2005. Additional FGD plants are being planned for several other coal-fired power stations in the UK.

The amount of desulphogypsum produced at FGD plants is dependent on two main factors: the electricity output of the station and the amount of sulphur in the coal. About 0.7 tonnes of high purity limestone are required for each tonne of desulphogypsum produced.

Synthetic gypsum is also produced by the neutralisation of acid effluent from the manufacture of titanium dioxide by the sulphate process at Huntsman Tioxide Ltd's plant at Grimsby. Production of white titanogypsum is used by Knauf for the manufacture of plasterboard at their Immingham plant. UK titanogypsum production reduced by half in 2004 (to approx. 100 000 tonnes per year) due to a reduction in plant capacity.

#### United Kingdom summary 2000–2004

Commodity	2000	2001	2002	2003	2004	2000	2001	2002	2003	2004

Source: Iron and Steel Statistics Bureau.

This table shows the consumption of fluxes used in iron and steelmaking. Dolomite and limestone are used in blast furnaces and in sinter plants, whilst lime and calcined dolomite, or dolime, are used in steelmaking. These figures do not entirely agree with those shown on p.61 for the production of limestone, dolomite and chalk for iron and steelmaking, even allowing for the conversion of lime and dolime to carbonate.

## United Kingdom summary 2000–2004

# Nickel

Alba Mineral Resources carried out exploratory drilling and other activities over the Arthrath nickel-copper prospect in Aberdeenshire. This property was investigated by Exploration Ventures Ltd in the late 1960s and early 1970s as part of a regional exploration programme over all the large Ordovician basic intrusions in north-east Scotland. A number of holes were drilled at that time and extensive low-grade nickel-copper sulphide mineralisation was found. Alba have announced the results of their initial investigation which included an intersection of 109.7 metres at 0.26% Ni, 0.29% Cu and 0.019% Co from 17.3 m depth. Elevated levels of platinum group elements (PGE) and gold were also reported.

# Petroleum and natural gas (also see Primary fuels)

Once again the price of crude oil was a major concern throughout the year. From just over \$40 per barrel at the beginning of January the price climbed to its yearly maximum of just over \$67 per barrel at the end of August after which it steadied somewhat (Figure 1). This represents a 225 per cent increase in price since January 2004. It is apparent from Figure 2 that the last few years have seen the maximum rates of increase after relative price stability through the 1990s and up to the end of 2003.

The post-consultation report for the Fifth Strategic Environmental Assessment (SEA5) was published in January 2005. The area of the report covered approximately 78 000 square kilometres of the East Shetland Platform, the Inner Moray Firth and the Inner and Outer Firth of Forth. Blocks in the area were subsequently included in the 23rd Offshore Oil and Gas Licensing Round (see below).

In February the UK and Norwegian governments announced that a Framework Treaty had been agreed for co-operation between the two countries. This would speed up the development of cross-border fields, construction of submarine pipelines and ensure optimal use of existing infrastructure.

In September the SEA6 report was published. This covered the area of the North Channel (between Scotland and Northern Ireland), the Firth of Clyde, most of the UK parts of the Irish Sea and Cardigan Bay. Public consultation closed on 31st January 2006.

During 2005 work started on the SEA7 area which comprises the UK designated area west of Scotland and extends several hundred kilometres from the Scottish coast into the North Atlantic Ocean and from the UK–Faroe Islands median line in the north to the UK–Irish median line in the south.

Details of data specifically acquired for the SEAs programme can be accessed through the UK DEAL website ([www.ukdeal.co.uk](http://www.ukdeal.co.uk)). Downloadable files of the SEA reports can be accessed at [www.offshore-sea.org.uk](http://www.offshore-sea.org.uk).

The UK DEAL Data Registry continued to develop in 2005. In particular, UKOOA commissioned a new feature illustrating pipeline systems where spare capacity could be made available, complying with the Industry Code of Practice (ICOP). This allows potential developers of new fields to identify appropriate infrastructure and negotiate fluid transportation with a third party.

Figure 1. The price of a barrel of Brent crude through 2005. The price peaked at over \$67 per barrel at the end of August.

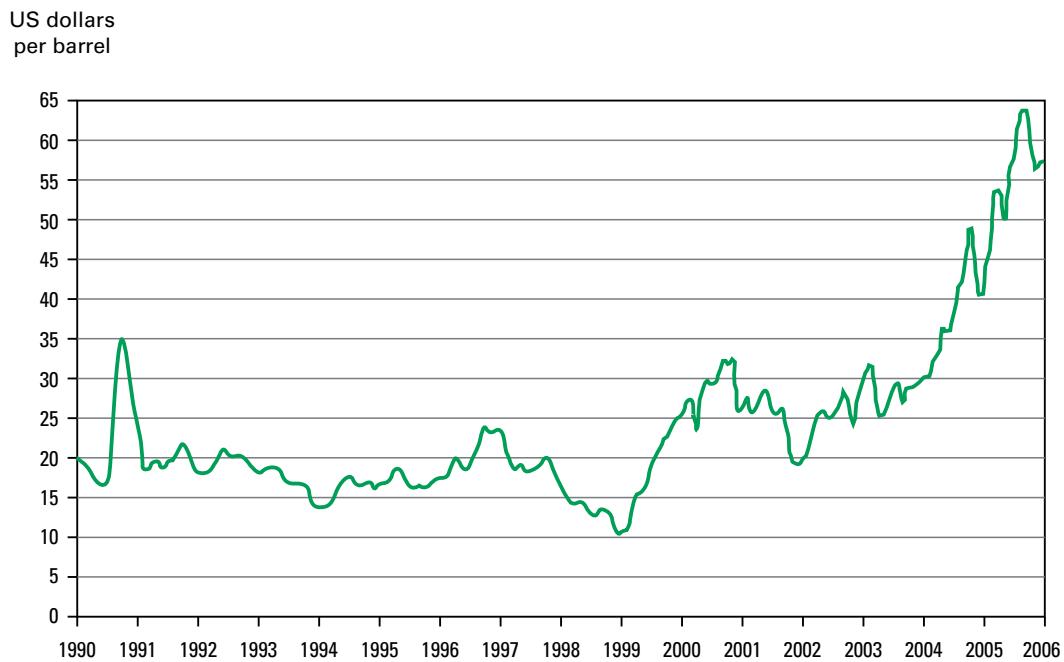

Figure 2. The price of a barrel of Brent crude. A rapid escalation in price has occurred since the start of 2004.

Another major development was the implementation of an entitlements system where registered oil company users could view their own data catalogues, submitted under DTI's Petroleum Operations Notice 9 (PON9) regulations. The DTI has a view of the whole data catalogue. Each oil company PON9 co-ordinator can now create a user ID and role for each member of their company directly.

In addition, the CDA (UKOOA) members' database of seismic navigation data was implemented. Layers of solid geology and bathymetry were also added to DEAL.

In July the DTI published updated figures (to the end of 2004) for UK ranges of hydrocarbon reserves and undiscovered resources. These were based on data provided by companies in January and February 2005 and included both onshore and offshore areas. The total UK reserves (including potential additional reserves and undiscovered resources) were estimated to be in the range 1002 – 1879 – 3611 million tonnes of oil (a slight increase on the previous year) and 888 – 1476 – 2666 billion cubic metres (bcm) of gas (a slight decrease). Cumulative production to date is 3005 million tonnes of oil and 1921 bcm of gas.

The annual economic report from the UK Offshore Operators Association (UKOOA), released in July, suggested that the UK will become increasingly dependent on oil and gas for its energy needs over the next ten to 15 years. Investment would have to be maintained at the current rate so that, by 2020, the UK was still able to produce 65 per cent of its total oil requirements and 25 per cent of gas requirements. The DTI predicted that, on an annual basis, gas import dependency might rise to 40 per cent by 2010–2011.

In November UKOOA released its revised forecast of capital expenditure on the UKCS for 2005 up from £3.8 billion in January to £4.5 billion with total spend for the year (which includes operation and exploration expenditure) being in the region of £11 billion. This is the highest level for seven years. Operating costs were also at a record level, up by £300 million compared with 2004 to £5 billion.

In December the Chancellor, in his pre-budget statement, announced an increase in Corporation Tax on UK oil and gas producers. This would raise the rate at which the industry pays Corporation Tax to 50 per cent. This unexpected extra tax burden was received with some dismay by UKOOA who estimated it would take an extra £6.5 billion out of the industry over the next three years at a time when the Treasury would already receive £11 billion in tax revenues from North Sea producers in 2005, double the amount paid in 2004.

#### *Development and production*

Twenty-one development wells were spudded onshore in 2005 compared with 14 in 2004. This is the first time in three years that the number has increased.

Similarly, the downward trend of offshore development wells being spudded was also reversed with 227 wells being started in 2005 compared with 166 in 2004 and 204 in 2003. The most active areas were the Central and Northern North Sea where 77 per cent of all development wells were drilled in 2005.

No new oil or gas fields were approved for development onshore in 2005. Offshore there were 13 new approvals:

Name of field	Field type	Block number	Operator at time of approval	When approved
Wood	Oil	22/18	Paladin	May
Blane (UK)	Oil	30/3a	Paladin	June
Enoch (UK)	Oil	16/13a	Paladin	June
Brenda	Oil	15/25b	Oilexco	November
Chestnut	Oil	22/2a	Venture	November
Maria	Oil	16/29a	BG	December
Forvie North	Condensate	3/15	Total	March
Munro	Gas	44/17b	ConocoPhillips	March
Cutter	Gas	49/9d	Shell	June
Garrow	Gas	43/21	ATP	July
Kilmar	Gas	43/22	ATP	July
Cavendish	Gas	43/19	RWE Data	August
Hunter	Gas	44/23	Caledonia	September

In the period from the beginning of January 1976 to the end of December 2005 there have been 157 oilfield, 122 gasfield and 29 condensate-field approvals.

The Elgin field in the Central North Sea was the biggest oil producing field on the UKCS in 2005. The reservoir here is Upper Jurassic sandstone. The Forties, Schiehallion, Alba and Foinaven fields were the next four biggest producers. Notably, all these produced from much younger Palaeogene reservoirs and two of them, Schiehallion and Foinaven, are located west of Shetland. Wytch Farm in Dorset was again the biggest onshore producing oilfield. This produced far more than the combined production from all other onshore fields.

The largest gas producing field was Morecambe South, followed by Leman, Nuggets, Sean and Morecambe North.

Several new oil and gas fields came on stream in 2005:

Field name	Field type	Discovery well	Date on stream	Operator
Brechin	Oil	22/23a-7	June	Paladin
Carnoustie	Oil	22/17-T2	February	Talisman
Clair	Oil	206/8-1A	February	BP
Farragon	Oil	16/28-17	November	BP
Gadwall	Oil	21/19-6	April	Venture
Pict	Oil	21/23b-1	June	Petro
Canada				
Rhum	Oil	3/29a-2	December	BP
Annabel	Gas	48/10a-12	April	Venture
Forvie	Gas	3/15-9a	December	Total
Horne	Gas	53/3c-3	June	Tullow
Munro	Gas	44/17b-7	August	BG
Saturn	Gas	48/10b-3	September	
ConocoPhillips Wren	Gas	53/3c-6	June	Tullow

The highlight was undoubtedly BP's giant Clair field situated approximately 75 km west of Shetland. The field was originally discovered in 1977 but development was delayed by technical and economic reasons. By the end of 2005 over 4.83 million barrels of oil and 1.31 billion cubic feet of gas had been produced from the field. It is estimated that 250 million barrels of oil are recoverable from the first part (Phase I) of the field development.

Decommissioning of surface installations associated with exhausted fields is becoming more common and is often an enormous undertaking. For example, Shell's Indefatigable gasfield in the southern North Sea, which came on stream in October 1971, is approaching the end of its economic life. Twenty-six wells, 21 km of pipelines within the immediate field area and five platforms will have to be dismantled and/or made safe. The platform weights, when installed, exceeded 13 500 tonnes. Other fields where decommissioning is planned are BP's North-west Hutton and Total's Frigg (UK part).

#### *Exploration*

Six onshore exploration wells were started in 2005, twice the number for 2004 and the highest since 2002. Two appraisal wells were also drilled (zero in 2004). However no onshore discoveries were made in 2005 and none have been made since the Avington 2 (Hampshire) discovery well in 2003.

Offshore, 41 exploration wells were spudded (the highest number since 1998) with 25 being in the Central North Sea. None was started west of Shetland for the first time in many years. There were seven significant discoveries:

Well	Hydrocarbon type	Operator at time of discovery	Date of discovery
13/23b-5Z	Oil	Talisman	September
21/5a-6	Oil	ConocoPhillips	November
21/5a-6Z	Oil	ConocoPhillips	November
22/6a-14Z	Oil	Apache	July
22/15-3	Oil/Gas	BG	December
43/25a-2W	Gas	GdF	May
44/23b-11	Gas	ConocoPhillips	September

BG, Century, Nexen and Talisman drilled more exploration wells than other companies, followed closely by Apache, Burlington and ConocoPhillips. The Finlaggan discovery (well 21/5a-6Z) proved a 169 ft hydrocarbon column in Lower Cretaceous sands. Thirty-seven appraisal wells (the highest number since 1996) were spudded, 21 of which were in the Central North Sea.

#### *Licensing*

In January the DTI published a new listing of fallow blocks and discoveries. This sixth release added 67 new fallow blocks and 23 new fallow discoveries to the list. The idea of this ongoing process is to force companies to either explore further, develop or relinquish acreage which they hold but on which they have not undertaken significant recent work.

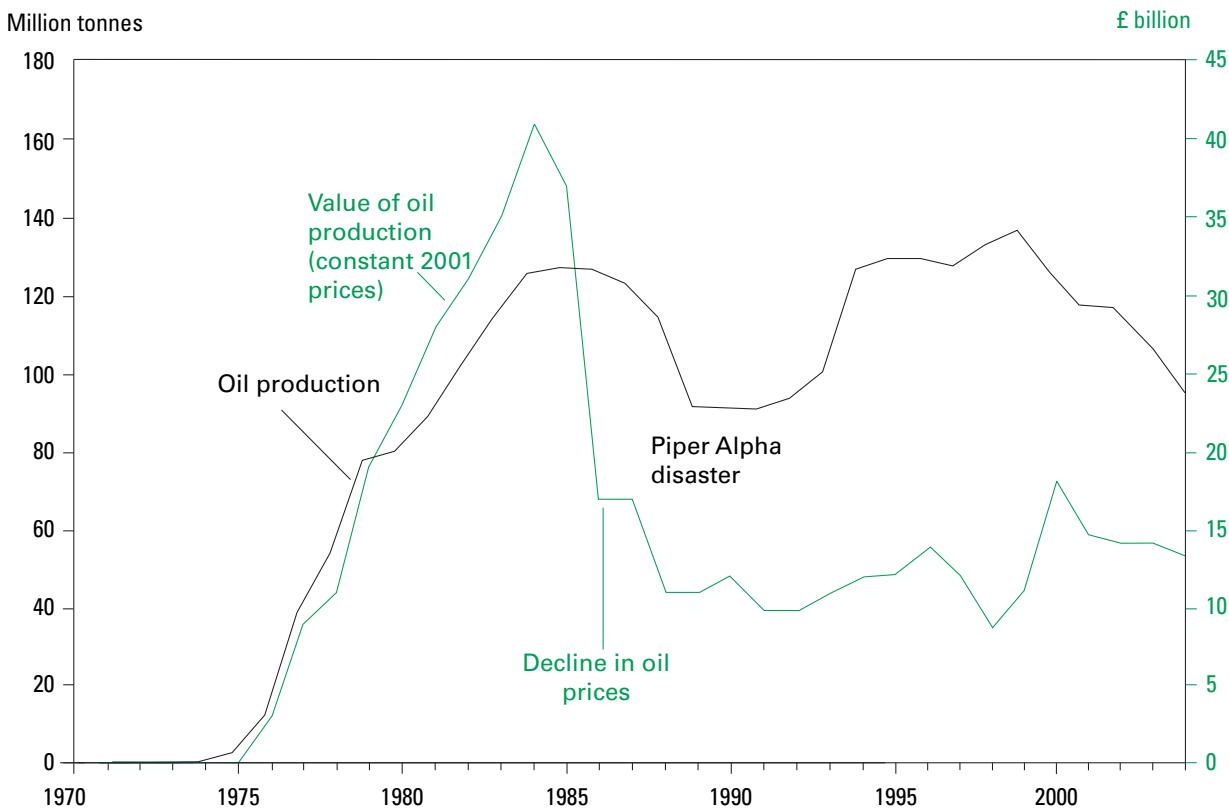

In March the DTI announced that a total of 1329 blocks would be open for companies to apply for licences in the 23rd Offshore Oil and Gas Licensing Round. This would include the whole of the North Sea and the west of Shetland area. 'Frontier' licences would be available in the west of Shetland area and 'promote' licences elsewhere in the North Sea. These two licence types include additional incentives to find oil and gas in new regions. Traditional licences would be available everywhere. Applications should be lodged by 9th June.

A total of 134 applications was received (seven frontier, 60 promote and 67 traditional) for 279 blocks. This involved 114 companies of which 28 were new applicants to the North Sea. Following interviews with the companies, and some rationalisation of the applications, the results of the round were announced in September. A record 152 licences (six frontier, 76 promote and 70 traditional) for 264 blocks were offered to 99 companies, 24 of which were new to the North Sea. The previous highest number of licences offered in a round was 118 in the 4th offshore round in 1972. Hence the 23rd round was regarded as a great success although firm commitments had only been received for 17 wells.

The year also saw 102 offshore licences, affecting 140 blocks or part blocks, surrendered either on a voluntary or mandatory basis.

There was no onshore licence round in 2005 as the DTI commenced a Strategic Environmental Assessment of the possible onshore hydrocarbon prospective areas of the UK. An announcement concerning the start of the next (13th) onshore round is planned for late Summer or Autumn 2006.

- (a) Gross production, i.e. includes own use for drilling purposes, production and pumping operations, but excludes gas flared and vented.
- (b) Rough was converted for use as an off-peak storage unit with effect from 1985.
- (c) Associated gas, mainly methane, produced and used mainly on Northern Basin oil production platforms including those in the CATS, FLAGS (including the Fulmar system), SAGE and SEAL systems.
- (d) From December 1998 to January 2001, Davy includes Brown.
- (e) Gas delivered to land via the Far-north Liquids and Associated Gas System from Brent, Clapham, North and South Cormorant, Kyle, Magnus, Magnus South, Murchison (UK), Pelican, Penguin, Statfjord (UK), Strathspay and Thistle.
- (f) Gas delivered to land via the Fulmar pipeline from Bittern, Clyde, Cook, Curlew, Fulmar, Gannet A-G, Guillemot A, NW and W, Howe, Kittiwake, Leven, Mallard, Medwin, Nelson, Orion, Teal and Teal South.
- (g) Gas delivered to land via the Central Area Transmission System from Andrew, Banff, Drake, Egret, Erskine, Everest, Fleming, Hawkins, Heron, Jade, James, Janice, Joanne, Judy, Lomond, Machar, Madoes, Marnock, Mirren, Monan, Mungo Seymour and Skua.
- (h) Associated gas used offshore or delivered to land via the Frigg pipeline system.
- (i) Gas delivered direct to Boddam (Peterhead) power station by dedicated pipeline.
- (j) Gas delivered to land via the Scottish Area Gas Evacuation system from Beinn, Beryl, Brae (Central, East, North, South and West), Braemar, Britannia, Caledonia, Maclure, Ness, Nevis, Scott, Skene, Thelma, Tiffany, Toni and Tulllich.
- (k) FFLAGS includes Fulmar.
- (l) Shearwater - Elgin Area Line (SEAL) includes Elgin, Franklin, Halley, Scoter and Shearwater.

# Potash

Potash is a generic term for a variety of potassium-bearing minerals and refined products. There are many potassium-bearing minerals but only those that are water-soluble are of significant commercial interest. Sylvine (potassium chloride, KCl) is by far the most important source of potash worldwide, because of its solubility and high potassium content, and accounts for all the potash produced in the UK to date. Potassium minerals rarely occur in pure form and the mined material is invariably a physical mixture of salts. Sylvinitite is a mixture of sylvine and halite (salt, NaCl) in varying proportions and this is the material that is mined in the UK. Potassium is one of the three primary nutrients essential for plant growth (the others being nitrogen and phosphorus). These nutrients form the basis of fertiliser production in the UK and throughout the world. About 90 per cent of UK potash production is consumed in the manufacture of fertilisers, with the remainder in a range of industrial applications.

There is only one source of potash in the UK, the Boulby mine in the North York Moors National Park. Production of potash is thought to have declined in 2005, to an estimated 800 000 tonnes KCl, a large proportion of which was exported through the company's deepwater terminal on the River Tees. This compares with production of 912 000 tonnes KCl in 2004. Rock salt production was 0.60 million tonnes in 2004. Salt is mined from the arterial roadways in the underlying Boulby Halite to maintain access to current potash mining areas and to explore and develop new areas for potash production.

Boulby Mine is operated by Cleveland Potash Ltd, a wholly-owned subsidiary of Israel Chemicals Ltd. The parent company is the second largest potash producer in Europe and the fifth largest in the world with a total output of some five million tonnes per year.

The Boulby mine employs some 800 people and is the single most important non-hydrocarbon mineral operation in Britain generating total sales approaching £100 million in 2004, including by-product rock salt. The workings extend some 14 km, reaching 5 km offshore to the north where they are approximately 750 m below the sea bed. In the south, a combination of seam dip and topographic relief takes the workings to more than 1300 m below the land surface.

The potash ore is a mixture of sodium and potassium chloride crystals with occasional inclusions of insoluble material, usually clays. Returning the insoluble waste material (mainly clay) into disused mine workings was started in 2003 thereby reducing discharges into the North Sea. Infrastructure and development work for the project was part funded by a European Commission grant.

# Salt

Salt (sodium chloride, NaCl), occurs in nature in solid form as rock salt (halite), or in solution as brine. Rock salt occurs in beds, commonly associated with mudstone, up to several hundred metres in thickness. Natural brine is produced by the dissolution of salt-bearing strata by circulating groundwater or by solution mining which entails injecting water into salt beds and pumping out the resulting salt solution. This may contain up to 26% NaCl when fully saturated.

Official figures for the production of rock salt and white (or brine) salt have not been disclosed for many years, but estimates have been made by the BGS. Production of rock salt, which is largely used for de-icing roads, is dependent on the weather. UK sales are estimated at 2 million tonnes in 2005. Rock salt is produced at three locations in the UK. The Winsford mine in Cheshire operated by the Salt Union is the largest source, but large tonnages are also produced at the Boulby potash mine in the North

York Moors National Park. The third producer, Irish Salt Mining and Exploration Co Ltd, operates the Kilroot mine at Carrickfergus in Northern Ireland and produced an estimated 250 000 tonnes in 2005. A proportion of the rock salt from this mine is exported to the eastern seaboard of the USA.

The Winsford mine, with some 26 million cubic metres of space, has a constant temperature and humidity and is dry and gas-free. Part of the mine is currently being used for secure document storage. In addition, the mine's Minosus waste disposal project cleared a final legal challenge in the High Court in December 2004. Limited hazardous waste disposal commenced in August 2005, pending the completion of simulated mine condition test methods that have to be approved by the Environment Agency. Approval was reached in March 2006 meaning that Minosus can now accept the full range of 42 different waste types it was designed for. To date input has been running at around 15% of capacity but is expected to double during the course of this year. Strict criteria will be used for the type of material stored, which will be dry waste that is non-flammable, non-biodegradable and non-radioactive.

In addition to the extraction of rock salt by underground mining, large quantities of salt are also produced by controlled solution mining. Production is now confined to Cheshire, where controlled solution mining is undertaken by two companies, Ineos Chlor Ltd and British Salt Ltd. Ineos Chlor supplies brine from the Holford brinefield for its own plant at Runcorn for the production of chlorine and caustic soda by the electrochemical process. The company also supplies brine to two plants operated by Brunner Mond in Northwich for the production of soda ash by the ammonia-soda process. Ineos has recently acquired Salt Union's vacuum (white) salt operations at Runcorn, which also uses brine from Holford.

British Salt Ltd also produces brine from the Warmingham brinefield in Cheshire for the production of white salt at its plant near Middlewich. British Salt is a wholly-owned subsidiary of US Salt Holdings. New Cheshire Salt Works Ltd extracts natural brine at the Wincham brinefield, near Northwich for the production of small quantities of white salt. Total UK production of white (brine) salt is estimated to be about one million tonnes and salt-in-brine for use as a chemical feedstock, 2.8 million tonnes.

At the Warmingham brinefield, specially created salt cavities have been produced for natural gas storage and a proposal by Scottish Power for gas storage at the Holford brinefield has recently been granted permission. A similar proposal has been made to create an underground natural gas storage facility to the east of the Wyre Estuary in the Preesall saltfield in Lancashire. Twenty cavities are being proposed by solution mining at depths of up to 350 m. Brine produced by creating new cavities will be discharged into the sea. Brine extraction ceased at the Preesall saltfield in 1993 because of the closure of the Hillhouse chlorine plant in Fleetwood. Portland Gas Ltd, a wholly owned subsidiary of Egdon Resources Plc, is planning to create a salt cavity for natural gas storage beneath the Isle of Portland in Dorset.

# Silica sand

Silica (industrial) sands contain a high proportion of silica ( $\text{SiO}_2$ ) in the form of quartz and are used for purposes other than as construction aggregates. They are essential raw materials for the glass and foundry castings industries, but also have a wide range of other industrial applications, including in ceramics and chemical manufacture, for water filtration media, and in sport and horticultural applications. Unlike construction sands, which are used for their physical properties alone, silica sands are valued for a combination of chemical and physical properties.

Silica sand production in the UK has remained around four million tonnes per year for several years. Total sales increased to more than five million tonnes in 2004. The significant increase in silica sand sales in 2004 is believed to principally reflect and improved coverage of mineral workings rather than a marked increase in demand. Of total output in 2004, over 90 per cent was produced in England, with almost all of the remainder from Scotland. However, with significant permitted reserves and identified resources, Scotland may become of increasing importance as a source of silica sand for UK industry in the future. The major producer is WBB Minerals, which accounts for over 50 per cent of total output and an even greater proportion of colourless glass sand production. Foundry sand production has been declining for a number of years, reflecting the general decline in UK manufacturing. However, glass sand production has increased somewhat in recent years due, in part, to the commissioning of two new float (flat) glass plants. St Gobain of France operates one at Eggborough in Yorkshire and a further plant at Goole operated by Guardian came on stream during 2003. Both plants are supplied from WBB Minerals' colourless glass sand operation at King's Lynn in Norfolk, the latter by rail. WBB Minerals also supplies Pilkington's float glass plants at St Helens from its site at Chelford in Cheshire.

# Tin

Baseresult Holdings Ltd, owners of the South Crofty tin mine and processing plant in Cornwall, submitted an application to Cornwall County Council providing details of future tin mining and ancillary operations in respect of a working plan and suggested planning conditions. This application is still in the process of discussion with the planning authority. The company has stated that 'Limited underground development has progressed steadily throughout the year as part of the preliminary mining programme. The tunneling is above the water table within the mine, with its initial aim to provide the mandatory secondary access'

Apart from this, the only remaining tin mining activity is the very small-scale production of cassiterite by tourist operations.

# Zinc

Anglesey Mining Company raised additional funds and drilled three deep holes (AMC15 – AMC17), totalling 1875 m, during the second half of 2005 at the Parys Mountain polymetallic Cu-Pb-Zn-Ag-Au deposit on Anglesey in North Wales. The holes were about 700 m north-east of the Morris Shaft and along the northern margin of the Parys Mountain volcanic complex. They intersected extensions of three known mineralised horizons and provided information on their continuity, thickness and grade. A new ore resource zone, the 'Garth Daniel' area, was identified. High grade intersections along the extension of the Engine Zone horizon, within the Garth Daniel area, of 2.5 m @ 6.34% Cu, 11.94% Pb, 22.26% Zn in AMC15 and 5.5 m @ 3.73% Cu, 6.06% Pb, 12.51% Zn in AMC17 were announced. A further drilling programme has been announced for 2006.
