*The full range of Survey publications is available from the BGS
Sales Desks at Nottingham, Edinburgh and London; see contact
details above or shop online at www.geologyshop.com.*

*The London Information Office also maintains a reference
collection of BGS publications, including maps, for consultation.*

*The Survey publishes an annual catalogue of its maps and other
publications; this catalogue is available from any of the BGS
Sales Desks.*

*The British Geological Survey carries out the geological survey
of Great Britain and Northern Ireland (the latter as an agency
service for the government of Northern Ireland), and of the
surrounding continental shelf, as well as its basic research
projects. It also undertakes programmes of British technical aid
in geology in developing countries as arranged by the
Department for International Development.*

Commentary

1. Introduction

Europe's relatively restricted land mass has a remarkable variety of geological terranes. It includes ancient crystalline 'shields' and massifs, complex younger fold-belts penetrated by igneous intrusions, deep sedimentary basins containing coal, petroleum and other minerals, and landscapes profoundly modified by a recent ice age. As a consequence Europe has a rich endowment of all the major groups of minerals. In the nineteenth century the continent's burgeoning industrial economies were built on its resources of metals and coal. The productive capacity of those resources was, with some exceptions, largely outgrown in the twentieth century but Europe continues to obtain a high proportion of its needs for industrial and construction minerals from within its own borders. In addition, a recent bonanza has been the discovery and exploitation of the offshore resources of petroleum and natural gas beneath the North Sea and other areas of the continental shelf.

During the industrial revolution of the eighteenth and nineteenth centuries the interest of sovereign states in their own economic and demographic performance led to the development of statism, that is, the direction and control of their internal affairs to a much greater degree than before. From statism came the concept of statistics – the numbers collected and compiled as the basis for such action by the state. Among many other things, almost all European countries compile annual statistics of national mineral production and trade and these form the basis of this European compilation¹.

For many countries, from antiquity, the ownership of precious metals has been vested in the state or the sovereign and for the majority of European countries state ownership extends to all metals and high-value industrial minerals. Chiefly as a result, in Europe and the world as a whole, there is a direct correspondence between the unit value of a mineral commodity and the amount and accuracy of official statistical information available on it. At the extreme high end of the value range this relationship tends to break down so that data on gemstones and precious metals is less straightforward than that on base metals. However, as a rule the state does not claim ownership of low-value construction minerals, such as sand and gravel, crushed rock aggregate and others. Partly as a consequence, the statistics for such minerals tend to be less comprehensive, less reliable and more difficult to compile and compare than those for other minerals. It is ironic that with modern environmental concerns and pressures on land-use in Europe it is precisely these less well-documented minerals – their occurrence, production, trade and consumption - that are of greatest concern to local and national governments.

So far as possible, the statistics of production compiled by the BGS are the official data for the countries concerned, whose government departments and agencies compile and publish them on the basis of returns from annual, or more frequent, inquiries in the form of mandatory questionnaires to producers. Trade statistics published by BGS are invariably compiled, directly or indirectly, from official publications. Where official production data are not available, or where there is reasonable cause to doubt the accuracy or completeness of such data, information is sought from other sources such as geological survey organizations, chambers of mines, universities, trade associations and the primary producers themselves. Time and resources preclude double-checking in any but the most necessary of cases.

An increasing problem, particularly in Europe, is the invocation of rules that debar a government body from divulging national production data if there is only a small number of producers, the object being the maintenance of commercial confidentiality. However, we often find in such cases that the primary producers themselves are willing to release the information for publication. A further issue lies in the desire of governments, everywhere, to recover costs by asking for payment for official information –

¹ For this compilation 'Europe' is defined as the 27 EU members (as of 1 February 2008), the EU associates Norway and Switzerland and the EU candidate countries Croatia, Macedonia and Turkey; this group of 32 countries is for convenience referred to as 'EU32'.

which is often marketed through an agent. This situation is coupled with an increasing apparent disregard for the value (as distinct from the price) of impartial mineral statistics and a conviction that their compilation should be funded entirely by the users of the data, or by the industrial sector concerned. It is true that no other industrial sector has a statistical operation wholly dedicated to its physical (as opposed to financial) activities. The reason is that no other industrial sector is so crucial to the maintenance of civilisation and so little understood by the population at large.

2. Construction minerals

The most important construction minerals and their chief uses are summarised below (Table 1):

Table 1 Construction minerals and their principal uses.

Aggregates, natural sand and gravel crushed rock (limestone, sandstone, igneous rock etc.)	<i>concrete, building sand and fill roadstone, fill, concrete</i>
Clay and shale	<i>bricks, pipes, tiles and cement manufacture</i>
Gypsum ²	<i>plaster, plasterboard and cement</i>
Limestone and dolomite	<i>crushed-rock aggregate, cement, other industrial and agricultural uses</i>
Building stone (dimension stone)	<i>this comprises almost any competent rock-type that may be used in the form of shaped and/or sized blocks for either structural or decorative purposes. It normally includes roofing stone and slate</i>

2.1 Statistical problems of aggregate minerals

Aggregates suffer from the incompleteness of available production data and incompatibility of different countries' production statistics for this group. The European data for aggregates presented here represent an attempt at compiling reliable data and we would welcome any comments, amendments and corrections that users may wish to make. Other problems are related to the terminology used by different countries. These can include such categories as:

'gravel and crushed rock' with no distinction between types of aggregate minerals

'building stone' that incorporates both crushed-rock aggregate and dimension stone

'limestone' and other purely petrological descriptions with no indication of the construction/industrial use split

'sand' with no distinction between material for construction sand and special sand for industrial uses e.g. for glass

With the establishment of the European single market on 1st January 1993 a new statistical system was introduced across the EU to measure production for sale (Prodcom). It covers many activities, including mining and quarrying. Information is presented on the volume and value of sales and the headings are compatible with trade headings, the intention being to provide an assessment of the apparent consumption of a particular product. However, the data for minerals are of highly variable quality.

² Statistics for gypsum are complicated by the availability of large quantities of synthetic gypsum, which is not covered in this publication.

2.2 European situation

The statistical tables in this volume show that it is possible to account in detail for at approximately 2800 million tonnes of primary aggregate production in the EU32 countries. In recent years the European Aggregates Association (UEPG) (www.uepg.eu) has estimated that the average annual production of primary aggregates in only 21 European countries is higher than the figures shown here. However, at the time of writing, their estimates for 2007 and 2008 were not available.

These totals easily exceed the total tonnage of all other minerals produced in the EU. This fact highlights the concerns expressed in many countries about the sustainability of the resource, both in terms of tonnage remaining and also the land-use and environmental issues that are raised by the implicit need for the expansion of quarries to maintain the level of output.

All European countries consume construction minerals, generally in proportion to the size of their individual economies. The majority of the EU member countries are self-sufficient in supply of aggregate minerals but while some, e.g. Finland, produce approximately equal quantities of sand & gravel and crushed rock aggregates others are, for obvious geological and topographic reasons, deficient in one or the other. For example, Netherlands lacks resources suitable for the production of hard rock aggregates while Austria, landlocked and without broad alluvial lowlands, is a net importer of sand and gravel. Simple statistical analysis, especially if only ‘gross’ national trade positions are examined, can be misleading: aggregates are low-cost minerals and are, as a result, sensitive to transport costs. They may be imported via a short cross-border route at lower cost than if they were carried a much greater distance within national borders.

For countries bordering the North Sea production of marine-dredged sand and gravel is a significant part of supply. In the case of the UK this source amounts to approximately 19 million tonnes per year or 22 per cent of total UK sand and gravel production in 2008. Almost one third of this tonnage is landed at foreign ports as exports. Crushed rock produced from onshore sites is also conveyed by sea from Norway and Scotland.

Recycled and secondary aggregates have become an increasingly important part of supply, in response to environmental constraints on the production of primary (quarried) material. In Great Britain these materials account for approximately 25 per cent of total supply. This is the highest in the EU32 countries in percentage terms although Germany is usually larger in total tonnage.

3. Industrial (non-construction) minerals

These comprise a wide range of non-metallic, non-energy minerals used as feedstocks for manufacturing or industrial processing aids, exemplified by barytes, fluorspar, magnesite, kaolin (china clay), mica, and salt. The category includes metallic minerals used for non-metallic products, e.g. bauxite, chromite, ilmenite and also ‘construction minerals’ used for non-construction purposes, e.g. limestone. Unlike metals, where whatever the extracted ore the ultimate refined marketable product is produced to a few accepted standards for use in a variety of applications, industrial minerals depend to a great extent on their intrinsic ‘as mined’ physical and chemical qualities. Thus, for industrial minerals the two most significant variables are the grade of the deposit, that is, how much useful mineral it contains, and the quality of the mineral, that is, its suitability for specific end-uses. The quality may be a combination of physical properties such as particle size and shape, brightness, viscosity in suspension, specific gravity, hardness, strength and insulating properties. Several industrial minerals are valued purely for their chemical composition, for example, the essential plant nutrients potassium and phosphorus or the halogens chlorine and fluorine and many other elements used as chemical feedstocks.

It has been suggested that the point at which the value of a country’s industrial mineral production (including construction minerals) overtakes that of its metal (mine) production marks its transition to a

mature industrial economy. Certainly this point was attained long ago for the major economies of Europe: the value of metal production in France, Germany, Italy and the UK is negligible compared to the value of industrial minerals output.

A problem for the compiler of statistics on industrial minerals is that many of them cannot be precisely defined, but grade into one another. Thus, kaolin grades into kaolinitic clay, bauxite into high-alumina clay, dolomite into limestone, and this has implications for the comparability of statistics between deposits and countries. Many industrial minerals are produced and marketed in either a ‘wet’, ‘dried’ or ‘calcined’ forms; this can markedly affect the weight of the material. In this compilation every effort has been made to ensure comparability between countries in this respect. Some mineral-derived elements may be obtained by a number of mineral-based but different routes: sulphur is obtained, in Europe, as a by-product from oil refining, from sour gas, from base metal smelting and as a primary product from pyrites (iron sulphide). Some semi-processed materials³ can be obtained from completely different sources, for example magnesia (magnesium oxide), which is produced from both magnesite and a combination of sea-water and dolomite. Salt is a further example, being extracted as a solid (rock salt), as brine and by the evaporation of sea water.

European production of industrial minerals⁴ supplies a fairly high proportion of the continent’s requirements, in contrast to the position with metals. However, in the cases of several minerals, production is dominated by one country and the majority are still dependent on imports for all but a few of these minerals. The proportions of selected minerals produced by Europe is given in Table 2.

Table 2 EU32 production of selected industrial minerals as world percentages.

Industrial mineral	% of world	EU32 countries with >2% of world output in 2008
Feldspar	62.1	Turkey (26%), Italy, France, Spain, Poland, Czech Rep.
Kaolin	28.2	Germany (13%), UK, Czech Republic
Bentonite	25.1	Greece (9.8%), Turkey, Germany
Magnesite	22.6	Turkey (8.9%), Slovakia, Austria
Gypsum	21.6	Spain (10.7%)
Salt	20.0	Germany (5.4%), Netherlands, France, UK
Talc	17.4	Finland (6.9%), France, Austria
Potash	12.5	Germany (9.9%)
Mica	8.4	France (5.3%), Finland
Fluorspar	3.8	Spain (2.4%)

4. Metals

Until the middle of the nineteenth century the demands of industry in Europe were met by indigenous metal mines but thereafter it became clear that the resources of other continents would become an important source of supply, having, as they did, very large and rich ore bodies that could be worked at relatively low cost. Initially, ores and concentrates were transported to Europe for processing. Many high-volume ores, notably iron ore, are still imported but smelting and refining of base metal concentrates has been increasingly undertaken at or near the sites of the overseas mines. Europe as a whole is now heavily

³In the case of several oxides, hydroxides and salts the yardstick for inclusion in this compilation is that the material should be the basis for a further transformation process although the compilers accept that this criterion has been applied in a flexible way.

⁴The tabulated statistics show that availability of reported data is much lower for industrial minerals than for metals, with many estimated totals being shown.

dependent on extra-European sources of virtually all metals although recycling makes an important contribution and, as the statistical tables show, several European countries still have significant mine production of one or more metals.

Certain European countries are major mine producers of particular metals, e.g. Turkey for chromium (8.1 per cent of the world total in 2008), Norway for titanium (7.1 per cent) and Poland for silver (5.4 per cent), but the majority of European countries depend chiefly on imports from other continents. Between 2007 and 2008, the overall mine production for metals produced in the EU32 generally decreased slightly, although the situation was mixed. Mine production of tungsten increased by nearly 13 per cent and chromium increased by nearly 12 per cent. However, the mine production of zinc decreased by nearly five per cent, mined copper and iron ore by just over four per cent each. The overall European position of mine production of selected metals in 2008 is shown in Table 3.

Table 3 EU32 mine production of selected metals as world percentages.

Metal	% world	EU32 countries with >1% of world output in 2008
Chromium	10.7	Turkey (8.1%), Finland
Silver	8.5	Poland (5.4%), Sweden, Turkey
Zinc	7.7	Ireland (3.4%), Sweden, Poland
Titanium	7.1	Norway (7.1%)
Lead	6.6	Sweden (1.6%), Poland, Ireland, Macedonia
Copper	5.1	Poland (2.8%)
Tungsten	3.7	Austria (2.0%), Portugal
Nickel	3.0	Greece (1.2%)
Mercury	3.0	Finland (3.0%)
Aluminium (bauxite)	1.8	Greece (1.0%)
Iron	1.4	Sweden (1.1%)
Gold	1.2	–
Manganese	0.3	–

European smelting and refining of imported ores and concentrates provides the bulk of supply in the cases of iron, aluminium (bauxite), zinc, lead, and copper. Refining in Europe of semi-processed materials from other continents accounts for a large part of nickel and tin supply but vanadium and cobalt metal are now entirely imported. Ferro-alloys of a number of metals are produced in Europe but imports of the major types are an indispensable part of total supply. The balance of metals supply is made up of imports of refined metal. It is emphasised that the situation of individual countries may vary widely from one to another, as the statistics indicate.

During 2008, most metals prices, including the major non-ferrous metals (copper, aluminium, lead and zinc), experienced a similar trend with increases during the first part of the year reversed by sharp declines as the global recession took effect at the end of the year. Many metals prices show some degree of recovery in the latter part of 2009. In 2008, China consumed 32 per cent of the world's total production of primary aluminium, 29 per cent of refined copper, 33 per cent of refined lead, 22 per cent of refined nickel, 39 per cent of refined tin, and 34 per cent of slab zinc (World Bureau of Metal Statistics). It continues to be the largest consuming country of these metals, often by a significant margin. China also consumed 32 per cent of crude steel production, but, although its per capita consumption increased to 318.5 kilograms, it is still lower than the EU(27) at 368.9 kilograms per capita (World Steel Association).

5. Energy minerals

These comprise petroleum, natural gas, coal and uranium. Statistics for production and trade of petroleum and coal are fairly complete and present few problems to compilers. However, the data for petroleum conceal the distribution of differing grades of crude oil. For example, although the UK is the second largest exporter of petroleum from the EU32 countries, there is also a significant import of heavy crude which is a necessary requirement that cannot be supplied by the North Sea and other offshore fields.

Before 1975, European production of both petroleum and natural gas was negligible but Europe produced 10.0 per cent of the world total for natural gas in 2008 and 5.6 per cent of petroleum. These percentages both show reductions on the 2004 figures which were 11.9 per cent and 7.4 per cent, respectively.

In 2008, Norway produced 3.0 per cent of total world output of oil and the United Kingdom produced 1.7 per cent. These two countries are the twelfth and eighteenth largest world producers respectively. Production in Norway has decreased by 22.6 per cent between 2004 and 2008, and in the UK by 26.4 per cent.

Coal output in Europe has been declining steadily for many years as deep mines become increasingly uncompetitive with sources in other continents. In 1981 production from the present EU32 countries was 1351 million tonnes. In 2008 production from the same territories was 669 million tonnes, of which half was provided by Germany (2.9 per cent of the world total) and Poland (2.2 per cent).

'Black coal' or 'hard coal' is normally taken to mean bituminous coal and anthracite. 'Brown coal' comprises sub-bituminous coal and lignite. Black coals have a higher calorific value and lower volatile content than brown coals, the use of which is almost confined to burning in electricity generating stations. Within black coals a fundamental division is made into 'steam coal', for power generation, and 'coking coal', used for metallurgical purposes, predominantly iron smelting in blast furnaces. An important distinction in mining methods is that between deep mines (with shafts or deep declines) and opencast or open pit mines. The latter have, as a rule, lower costs and are therefore more profitable. Both methods give rise to planning and social concerns.

In 2008, mine production of uranium in the EU32 countries amounted to 481 tonnes U₃O₈ equivalent, or 0.9 per cent of the world total, chiefly attributable to the Czech Republic. The EU32 countries occupy the top four positions for the amount of electricity generated from nuclear power in 2008 (International Atomic Energy Agency). These countries are France, Lithuania, Slovakia, and Belgium with the proportions ranging from 76.2 per cent to 53.8 per cent.

In January 2008, the UK government gave formal backing to the building of new nuclear power stations by private operators and in November 2009 announced the ten proposed locations for the plants. The first might be producing electricity by 2018. In 2008, the UK derived 13.5 per cent of its electricity from nuclear power.

The overall European position with regard to production of energy minerals in 2008 is shown in Table 4.

Table 4 EU32 production of energy minerals as world percentages.

Mineral	% world	EU32 countries with > 1% of world output 2008
Coal	10.1	Germany (2.9%), Poland, Turkey
Natural gas	10.0	Norway (3.1%), Netherlands, UK
Petroleum	5.6	Norway (3.0%), UK
Uranium	0.9	-

Explanatory notes

The statistics in this publication are from the World Mineral Statistics database.

Coverage

European Mineral Statistics covers the majority of economically important, and internationally traded, mineral commodities. For each commodity constant efforts are made to ensure that as many producing and trading countries as possible are reported and that trade data cover all major traded forms. For some commodities, where statistics on production and trade are not publicly available, estimates are made. Users of this compilation are advised that more statistical information than can be included in a publication of this nature is held in the BGS files and is available for consultation.

Production

Metals Mine production of many metals is expressed in terms of metal content. This is clearly indicated adjacent to the commodity description. Unless otherwise specified, metal production statistics relate to metal recovered from both domestic and imported materials, whether primary or secondary, but exclude remelted material.

Trade

Although every effort has been made to provide comprehensive coverage of trade statistics the resulting trade compilations depend on the nature of the data available. The fact that a country is not shown as trading in a particular commodity does not necessarily imply that there is no trade in that item. The commodity may not be separately identified in the available trade statistics or may not be traded in significant quantities.

Where an estimate for a trade statistic has been reconstructed from the imports/exports of other countries, the resulting figure may be conservative, as complete coverage of world trade is seldom available. Export statistics may include re-exports.

Tables showing trade in the following metals covered by Harmonised System Chapter 81 include under the term 'metal', unwrought and wrought forms, powder, alloys, waste and scrap, unless these are separately shown: antimony, bismuth, cadmium, chromium, cobalt, manganese, molybdenum, tantalum-niobium, titanium, tungsten, vanadium and zirconium. Trade tables of other metals include only unwrought forms under the term 'metal'.

Exclusion of warranty

Use by recipients of information provided by the BGS, is at the recipients' own risk. BGS has taken care to ensure that information provided is as free from error as is reasonably practical. In view of the disparate sources of information at BGS's disposal, including such material donated to BGS, that BGS accepts in good faith as being accurate, the Natural Environment Research Council (NERC) gives no warranty, expressed or implied, as to the quality, accuracy, performance, and merchantability of the information supplied, or to the information's suitability for any use whether made known to BGS or otherwise. NERC/BGS accepts no liability whatever in respect of loss, damage, injury or other occurrence however caused.

Acknowledgements

Compilation of this volume of mineral statistics has been possible only by obtaining information from a very large number of organisations throughout the world, chiefly home and overseas government departments and specialist national or international authorities concerned with particular sectors of the minerals or metals industries. To all these bodies the British Geological Survey expresses its grateful acknowledgement for the information made available, whether in published form or provided by direct correspondence.

Particular acknowledgement is made to the Mines Departments and other government agencies of many countries whose regular statements, yearbooks and other reports are worthy of direct consultations by readers in search of detail.

Specialist commodity organisations which have kindly allowed information to be reproduced include the International Copper Study Group, the International Lead and Zinc Study Group, the International Nickel Study Group and the International Fertilizer Industry Association Ltd. In a few instances, information on specific commodities has been obtained directly from company sources. The co-operation of other members of the International Consultative Group on Non-Ferrous Metal Statistics is also gratefully acknowledged.

Supplementary information is also obtained from publications dealing with a wider range of commodities such as Société de l'Industrie Minérale, *Annuaire Statistique Mondial des Minéraux et Métaux*; Mining Journal, *Country and Commodity Reports*; World Bureau of Metal Statistics, *World Metal Statistics* and *Metallstatistik*; publications of the Interstate Statistical Committee of the CIS, the United States Geological Survey, and the United Nations Statistics Division.

In addition, information has been obtained from the websites of the following organisations, companies, statistical offices and government departments: United Nations; Kaolin & Plastic Clays Europe; International Iron and Steel Institute (now known as the World Steel Association); Eurofer; World Nuclear Association; Eurostat; European Aggregates Association; Inmet Mining; Aluminium de Grece; New Boliden; Eurozinc Mining Corporation; Rio Narcea; Lundin Mining; Vereinigung der Österreichischen Zementindustrie, Austria; Federation de l'Industrie Cimentiere Belge, Belgium; Statistics Belgium; Czech Republic Statistical Office; Statistics Denmark; Geological Survey of Finland; Federation des Minerais, Mineraux Industrielles et Metaux non Ferreux, France; Comite Professionel de Petrole, France; Ministere de l'Economie, des Finances et de l'Industrie, France; Unicem, France; Infociments, France; Statistisches Bundesamt Deutschland, Germany; National Statistical Service of Greece; Federacciai, Italy; Unione Petrolifera, Italy; Istituto Nazionale di Statistica, Italy; Statec, Luxembourg; Centraal Bureau voor de Statistiek, Netherlands; Staatstoezicht op de Mijnen, Netherlands; Statistisk Sentralbyra, Norway; Geological Survey of Norway; Instituto Nacional de Estatistica, Portugal; Unesid, Spain; Sveriges Geologiska Undersökning, Sweden; Jernkontoret, Sweden; Statistiska Centralbyran, Sweden; Department for Business, Innovation and Skills, United Kingdom; Office for National Statistics, United Kingdom; The Crown Estate, United Kingdom.

Units

The Statistics shown in this volume are expressed in metric units. The following factors are given for converting to non-metric units:

tonnes $\times 0.9842$ = long tons

tonnes $\times 1.1023$ = short tons

kilograms $\times 2.2046$ = pounds

kilograms $\times 32.1507$ = troy ounces

cubic metres $\times 35.3147$ = cubic feet

1 tonne of crude petroleum equals on average 7 barrels of crude petroleum

1 flask mercury = 34.5 kilograms

1 metric ton unit = 10 kilograms

Conversion of national currencies to pounds sterling has been made using the annual average factors shown for each country in *International Financial Statistics* published by the International Monetary Fund.

BGS	British Geological Survey
c.i.f.	Cost, Insurance and Freight. The seller's price includes the cost of the goods, the insurance of the goods to their destination port, and the cost of freight.
f.o.b.	Free on Board. The seller is responsible for the cost of delivering goods to the ship. The buyer is responsible for transportation and insurance costs from that point.

Table notes for country tables

Aggregates – production

- (1) So far as possible, these statistics include construction sands; gravel, pebbles, shingle and flint; crushed stone used for concrete aggregates, roadstone and other construction use; granules, chippings and powders, listed under Prodcom codes 14211190, 14211210, 14211230, 14211250, 14211290
- (2) Where official sources show more than one series for aggregates the higher series has generally been used in this compilation
- (3) Where marine sands and gravels have been identified, these are included
- (4) Information may be incomplete or absent due to reporting methods, confidentiality or lack of available information. All EU32 countries produce sand and gravel and crushed rock
- (5) Production from many small operations are not officially compiled. The minimum number of employees for which establishments are required to report production varies between different countries and can also vary from year to year within a country
- (6) Quantities of sand from sand and gravel operations may be discarded due to low demand. This may or may not be included in the statistics

Aggregates - exports and imports

- (1) These statistics include construction sands; pebbles, gravel, shingle, flint; crushed rock; granules, chippings and powders covered by the Harmonised System codes 2505.90, 2517.10, 2517.41 and 2517.49
- (2) Exports include marine dredged sand and gravel landed at foreign ports

Bauxite - production

- (1) Including production of refractory bauxite

Alumina - production

- (1) Where possible figures show the alumina equivalent (Al_2O_3) of total hydrate produced, whether or not calcined

Bauxite, alumina and aluminium - exports and imports

- (1) Except where alumina hydrate is separately specified, national trade figures for alumina can be considered as inclusive of hydrate
- (2) The term 'unwrought' aluminium corresponds to item 7601 of the Harmonised System and comprises ingots, blocks, unwrought bars, etc.
- (3) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Antimony - mine production

- (1) Including antimony content of antimonial lead alloys

White arsenic - production

- (1) Including calculated trioxide equivalent of arsenic metal produced except where this would involve double counting

Arsenic - exports and imports

- (1) Data relating to arsenic are not fully recorded by many countries

Barytes - production

- (1) Small quantities of witherite may be included

Barytes - exports and imports

- (1) Trade in barytes is reported under item 2511 of the Harmonised System and is described as 'barytes and witherite'. However, only small quantities of witherite are traded

Bentonite and fuller's earth - production

- (1) Bentonites consist of montmorillonite (one of the smectite group of clay minerals) and occur in two main varieties, calcium bentonite, the most commonly occurring, and sodium bentonite, industrially the more important
- (2) Calcium bentonite can be converted to sodium bentonite by a sodium-exchange process
- (3) In some countries, such as the United Kingdom, calcium bentonite is known as fuller's earth, a term which is also used to refer attapulgite, a mineralogically distinct clay mineral but exhibiting similar properties

Bentonite and fuller's earth - exports and imports

- (1) See notes 1 - 3 under production
- (2) The figures refer to natural and sodium-exchanged bentonite, and fuller's earth, Harmonised System 2508.10 and 2580.20
- (3) Activated bentonite and fuller's earth, Harmonised System 3802.90 are excluded
- (4) Some countries are believed to include sodium-exchanged bentonite, often referred to as activated bentonite, under Harmonised System 3802.90, e.g. Italy
- (5) From 2007 Harmonised System 2508.20, used for fuller's earth, is no longer available

Bismuth - mine production

- (1) In some instances the figures are derived from reported bismuth content of refined and impure metal plus recoverable in ores and concentrates exported
- (2) Production for some countries may include bismuth produced from imported ores but it is thought that any resulting duplication is insignificant in the countries shown

Bismuth - exports and imports

- (1) The compounds are bismuth carbonate and/or bismuth nitrate

Bromine - exports and imports

- (1) Trade in bromine is not separately distinguished from other halogens by many countries

Cadmium - production

- (1) Data exclude secondary metal

Chromium - exports and imports

- (1) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Coal - production

- (1) There is no international agreement as to the separate definition of lignite and brown coal. In some cases they are distinguished. Elsewhere both may be aggregated under one or other term

Coal - exports

- (1) Excludes bunker shipments

Cobalt metal - production

- (1) In addition, several countries including the United Kingdom, Finland and France are known to produce substantial amounts of cobalt compounds

Copper - smelter production

- (1) Primary metal in the form of blister and anode produced from concentrates is shown, and may include copper produced from scrap but this is excluded when it can be separately identified

Refined copper - production

- (1) Figures relate to both primary and secondary refined copper, whether electrolytic or fire refined. Metal recovered from secondary materials by remelting alone is excluded

Copper - exports and imports

- (1) The term 'unwrought' copper corresponds to items 7402, 7403 and 7405 of the Harmonised System and includes both unrefined (including blister) and refined copper
(2) The term 'unwrought', as used here, includes alloys unless these are separately specified. The term 'scrap' includes scrap alloys

Diamond - exports and imports

- (1) Carats have been used as the unit except where the only obtainable figure is the value. In these cases the national currency figure has been converted to £ sterling
(2) See explanatory notes regarding currency conversion
(3) The term 'Dust' corresponds to item 7105.10 of the Harmonised System and includes both natural and synthetic diamond dust

Gold - mine production

- (1) In several countries substantial amounts of gold produced in small operations are not recorded in the official statistics

Gold - exports and imports

- (1) The term 'metal' includes both unwrought and partly worked gold and alloys but excludes gold coin
(2) Kilograms have been used as the unit except where the only obtainable figure is the value. In these cases the national currency figure has been converted to £ sterling.
(3) See explanatory notes regarding currency conversion

Graphite - production

- (1) Including all forms of amorphous and crystalline graphite but excluding synthetic material

Graphite - exports and imports

- (1) Excluding synthetic graphite

Gypsum - production

- (1) Some countries produce large quantities of synthetic gypsum. Where possible, this output is excluded

Gypsum - exports & imports

- (1) The term 'crude' may include some anhydrite

Pig iron - production

- (1) Sponge iron and direct reduced iron (DRI) are included where these have been separately identified

Crude steel - production

- (1) Figures include production from scrap unless otherwise indicated

Iron, steel and ferro-alloys - exports and imports

- (1) The term 'ingots, blooms, billets' corresponds to items 7206, 7207, 7218 and 7224 of the Harmonised System which includes those of alloy and high carbon steel

Refined Lead - production

- (1) Figures relate to both primary and secondary refined lead and include the lead content of antimonial lead. Metal recovered from materials by remelting alone is excluded

Lead - exports and imports

- (1) The term 'unwrought' lead corresponds to item 7801 of the Harmonised System and comprises base bullion, pigs, unwrought bars, etc
(2) The term 'unwrought', as used here, includes alloys unless these are separately identified.

Magnesite and magnesia - exports and imports

- (1) The term 'magnesia', as used here, includes dead-burned, sintered and caustic-burned (caustic calcined) material

Manganese - exports and imports

- (1) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Mercury - production

- (1) Several countries are believed to have unrecorded production of mercury from copper electrowinning processes

Mica - exports and imports

- (1) Data show unmanufactured mica and include sheet, block, splittings, ground and waste, unless these are separately specified. Mica powder is included under the term 'ground'

Molybdenum - exports and imports

- (1) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Nickel - smelter/refinery production

- (1) Data relate to refined nickel plus the nickel content of ferro-nickel, nickel oxide and nickel salts

Nickel - exports and imports

- (1) The term 'unwrought' nickel corresponds to item 7502 of the Harmonised System which excludes all electro-plating anodes
(2) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Crude petroleum - production

- (1) The figures include natural gas liquids

Natural gas - production

- (1) Flared or reinjected gas is excluded as far as possible

Natural Gas - exports and imports

- (1) This table includes both liquified natural gas (HS code: 271111) in tonnes and natural gas in gaseous state (HS code 271121) in tonnes of oil equivalent
(2) To convert figures from million tonnes (of oil equivalent) to billion m³, multiply by 1.11

Platinum group metals - exports and imports

- (1) The term 'Platinum' and/or 'Platinum metals' includes unwrought, partly worked and alloys
(2) Kilograms have been used as the unit except where the only obtainable figure is the value. In these cases the national currency figure has been converted to £ sterling.
(3) See explanatory notes regarding currency conversion

Rare earths - exports and imports

- (1) Rare earths are here taken to include yttrium and scandium

Salt - production

- (1) Refined salt is excluded
(2) Salt is known to be produced in many countries for which statistics are not available.

Sillimanite minerals - production

- (1) A number of other countries produce sillimanite minerals but details of output are not reported

Sillimanite minerals - exports and imports

- (1) 'Sillimanite minerals' is understood to include any or all of andalusite, kyanite, sillimanite and mullite

Silver - exports and imports

- (1) Excluding silver coin but including silver shipped for minting
(2) The term 'metal' includes both unwrought and partly worked silver and alloys

Tantalum and niobium - exports and imports

- (1) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Tin - exports and imports

- (1) The term 'unwrought' tin corresponds to item 8001 of the Harmonised System and comprises ingots, pigs, unwrought bars, sticks, etc

Titanium minerals - production

- (1) The figures refer to gross tonnage of titanium concentrates

Titanium - exports and imports

- (1) Significant quantities of titanium slag are traded, but it is not always possible to identify this material in national trade accounts
(2) So far as possible, the term 'oxides', includes oxides and oxide based pigments classified under Harmonised System items 2823 and 3206.10
(3) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Tungsten - exports and imports

- (1) Significant amounts of tungsten are traded in the forms of ammonium paratungstate (APT) and carbide. Though statistics are included where available, most countries do not separately distinguish these forms in their trade accounts
(2) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Uranium – mine production

- (1) Excludes uranium production from decommissioning operations.

Vanadium - exports and imports

- (1) The term 'pentoxide' also includes vanadium oxides and hydroxides, if any
(2) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

Zinc - exports and imports

- (1) The term 'unwrought' zinc corresponds to item 7901 of the Harmonised System and comprises blocks, pigs, slabs, etc

Zirconium - exports and imports

- (1) Metal traded in ferro-alloy form is included under Iron, Steel and Ferro-alloys

STATISTICAL TABLES BY COUNTRY

Austria

Production

Commodity	Units	2004	2005	2006	2007	2008
Primary aggregates						
Sand and gravel (a)	tonnes	29 395 685	29 065 350	27 281 864	29 230 545	32 221 208

Note(s):-

(1) Bulgaria is believed to produce chromite, fluorspar, magnesite and platinum group metals

- (a) From metal sulphide processing
- (b) From petroleum refining and/or natural gas

Note(s):-

- (1) Denmark is believed to produce kaolin
- (2) In addition to the countries producing sillimanite minerals, synthetic mullite is known to be produced in Denmark

- (a) Moler is an impure diatomite containing a large proportion of clay
- (b) From petroleum refining and/or natural gas

Note(s):-

- (1) France may produce fuller's earth
 (2) In addition to the countries producing sillimanite minerals, synthetic mullite is known to be produced in France
 (3) Significant quantities of germanium are believed to be recovered from imported domestic material

- (a) Including anhydrite
 (b) Including mica recovered from mica schists and/or kaolin beneficiation
 (c) Salt; all forms
 (d) From petroleum refining and/or natural gas
 (e) Other

Note(s):-

- (1) Germany is believed to produce strontium minerals and tellurium metal
- (2) Significant quantities of germanium are believed to be recovered from imported or domestic material

- (a) Including anhydrite
- (b) Including manganeseiferous iron ore
- (c) Used as aggregate in the construction industry
- (d) Washed and dried
- (e) From petroleum refining and/or natural gas
- (f) Other

Slab zinc	tonnes	155 500	137 300	133 900	141 900	142 500

Note(s):-

(1) Poland is believed to produce strontium minerals

(a) Includes an estimate for small producers

(b) Metal production

(c) Including anhydrite

(d) Washed

(e) From metal sulphide processing

(f) From petroleum refining and/or natural gas

Note(s):-

(1) Turkey is believed to produce diatomite and wollastonite

- (a) From petroleum refining and/or natural gas
 (b) Other

Talc	tonnes	3 881	6 000	4 325	2 850	2 410

Note(s):-

- (1) United Kingdom is believed to produce arsenic
(2) In addition to the countries producing sillimanite minerals, synthetic mullite is known to be produced in the United Kingdom

- (a) Includes small quantities for other purposes in Northern Ireland
- (b) Saleable production based on data from producing companies
- (c) Including anthracite
- (d) China stone
- (e) Sales
- (f) Dry weight
- (g) Used for purposes other than salt-making
- (h) From petroleum refining and/or natural gas

Note(s)

- (a) Includes a substantial precious metal content, mainly silver
 (b) Including manganiferous iron ore

STATISTICAL INFORMATION BY COMMODITY

Primary aggregates

- Primary aggregates are sand, gravel and crushed rock aggregates that are widely used in the construction industry. The trade data presented here are for crushed rock combined with sand and gravel.
- Aggregates data are very difficult to establish with satisfactory precision. There are frequent inconsistencies in the way countries report aggregates production and trade. Different definitions for similar materials are commonplace, and many countries do not require production to be reported from quarries that have less than a certain number of employees.
- Aggregates are used primarily by the construction industry to build and maintain the physical infrastructure on which everyone depends: houses, offices, roads, schools, hospitals, railways, shops, flood defences, etc. Aggregates are either used directly, for example for drainage or fill purposes, or are used to manufacture concrete and asphalt.
- France was the largest EU32 producer of primary aggregates in 2008, with just over 400 million tonnes (15 per cent of EU total), closely followed by Germany (14 per cent). This was the first time for many years that the output from these two countries was higher than Spain and this was due to a significant drop in Spain's production (down nearly 11 per cent compared to 2007).

Aggregates

Production continued

Note(s)

- (1) So far as possible, these production statistics include construction sand; gravel, pebbles, shingle and flint; crushed stone used for concrete aggregates, roadstone, and other construction uses; granules, chippings and powders. Listed under Prodcom codes 14211190, 14211210, 14211230, 14211250 and 14211290.
- (2) Where official sources show more than one series for aggregates the higher series has generally been used in this compilation
- (3) Where marine sands and gravels have been identified, these are included
- (4) Information may be incomplete or absent due to reporting methods, confidentiality or lack of available information. All EU32 countries produce sand and gravel and crushed rock
- (5) Production from many small operations are not officially compiled. The minimum number of employees for which establishments are required to report production varies between different countries and can also vary from year to year within a country
- (6) Quantities of sand from sand and gravel operations may be discarded due to low demand. This may or may not be included in the statistics
 - (a) Sales
 - (b) Deliveries
 - (c) Includes construction sand and silica sand. Excludes gravel
 - (d) Includes gravel
 - (e) Includes an estimate for small producers
 - (f) Includes small quantities for other purposes in Northern Ireland

Aggregates - EU32 trade in 2008

Bauxite

- Bauxite is the only source of aluminium that is currently mined and is produced by deep chemical weathering of rocks in tropical to sub-tropical climates. There is limited EU32 production, leaving a very strong dependence on imports from countries outside the EU32.
- The chief use of bauxite is as a raw material for the production of alumina (aluminium oxide) the majority of which is converted to aluminium metal by electrolysis. Approximately ten per cent of bauxite is non-metallurgical grade and most of this is calcined for use in the abrasive or refractory markets.
- Australia continued to be the world's largest producer in 2008, with 31 per cent of the total world output. Greece was the largest producer within the EU32, with 58 per cent of EU32 production.
- Metallurgical grade bauxite is generally traded on long-term contracts and typical prices are not published. Chinese refractory grade bauxite generally traded in the range US\$550 per tonne to US\$650 per tonne for much of 2008, with Guyanan calcined bauxite slightly higher. However, as the global recession took hold, prices slipped to around US\$550 per tonne in January 2009 and to US\$400 per tonne to US\$535 per tonne by the end of 2009.

Note(s)

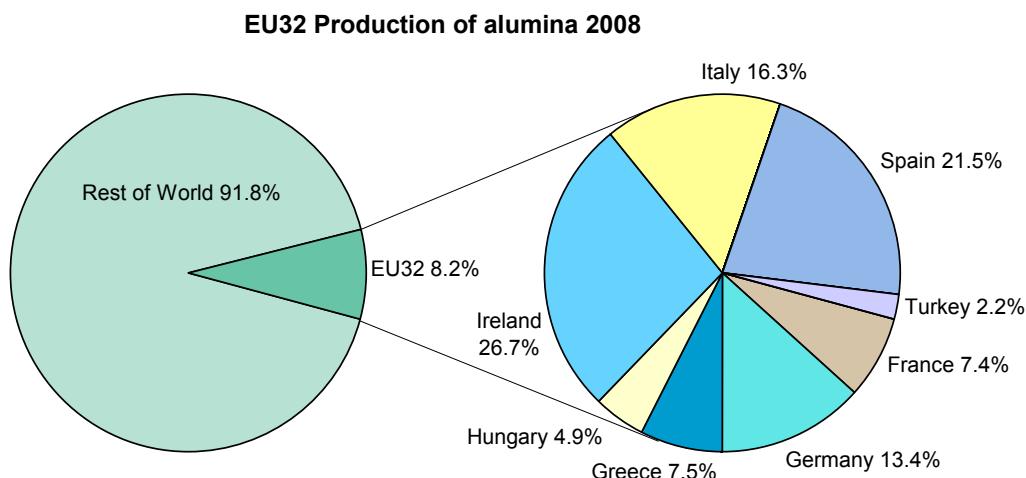

(1) This table includes production of refractory bauxite

EU32 Production of bauxite 2004 - 08

Alumina

- Alumina (aluminium oxide) is an intermediate product in the manufacture of aluminium metal from raw bauxite ore. Alumina hydrate is a form of alumina containing combined water and used in the paper, petroleum, paint and other industries.
- China was the world's largest producer of alumina in 2008, with an increase in output of 17 per cent compared to 2007. The EU32 produced 6.7 million tonnes in 2008, representing 8.2 per cent of world production.
- Spot prices for metallurgical grade alumina fell during the latter part of 2008, as a result of the global recession, and continued to fall during the first part of 2009 reaching a low of US\$170 per tonne to US\$185 per tonne during March 2009, the lowest price since January 2003. However, prices subsequently recovered to end 2009 in the range US\$295 per tonne to US\$315 per tonne.

(1) Where possible, figures in this table show the alumina equivalent (Al_2O_3) of total hydrate produced, whether or not calcined

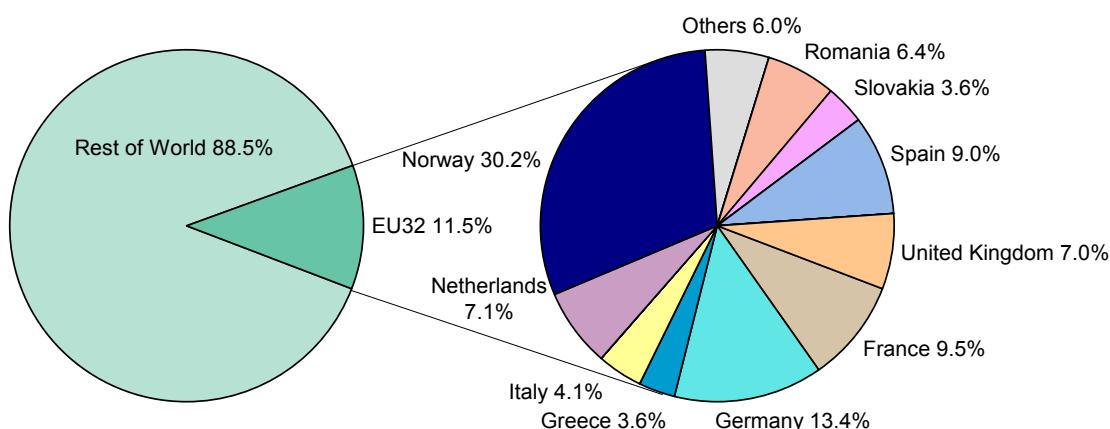

EU32 Production of alumina 2004 - 08

Aluminium metal

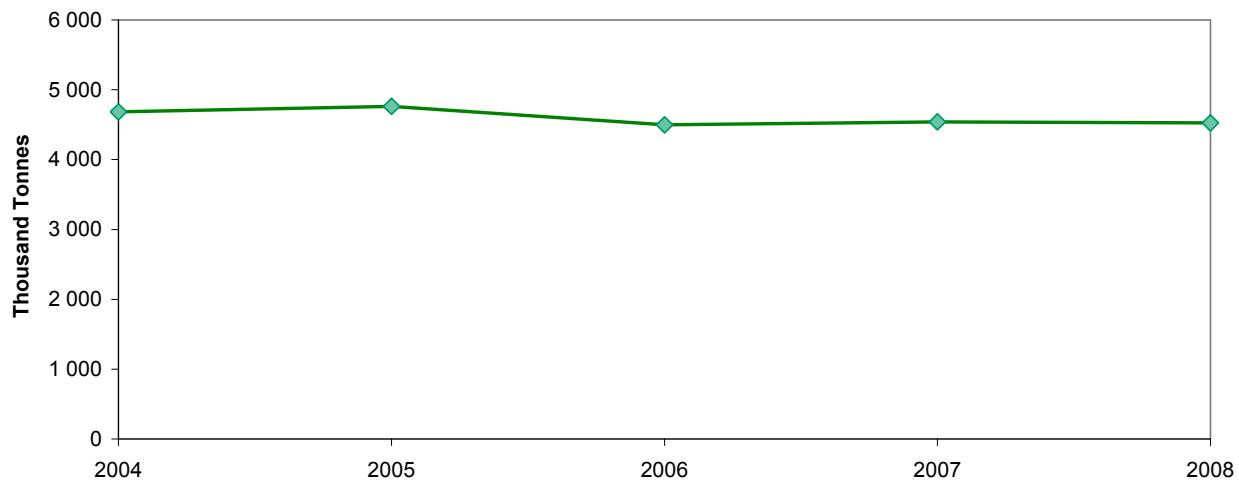

- Aluminium is a strong, lightweight metallic element that has many applications. The chief uses are in transportation, packaging and construction.
- China remained the world's largest producer in 2008, with 33 per cent of world production. The EU32 produced 4.5 million tonnes, representing 11 per cent of world production. Norway was the largest EU32 producer, with 30 per cent of the EU32 output.
- The London Metal Exchange official daily cash price for aluminium ingot increased sharply during the early part of 2008, reaching a peak of US\$3200 per tonne by July 2008. However, this was followed by an equally sharp fall towards the end of 2008 and this continued during the early months of 2009, reaching a low of US\$1253 per tonne in February, a drop of 62 per cent from its July 2008 peak. During the latter part of 2009, however, the price experienced a generally upward trend, finishing 2009 at US\$2200 per tonne.

Note(s)

- (1) Except where alumina hydrate is separately specified, national trade figures for alumina can be considered as inclusive of hydrate
 (2) In this table the term 'unwrought' aluminium corresponds to item 7601 of the Harmonised System and comprises ingots, blocks, unwrought bars, etc.
 (3) Metal traded in ferro-alloy form is included under iron, steel and ferro-alloys

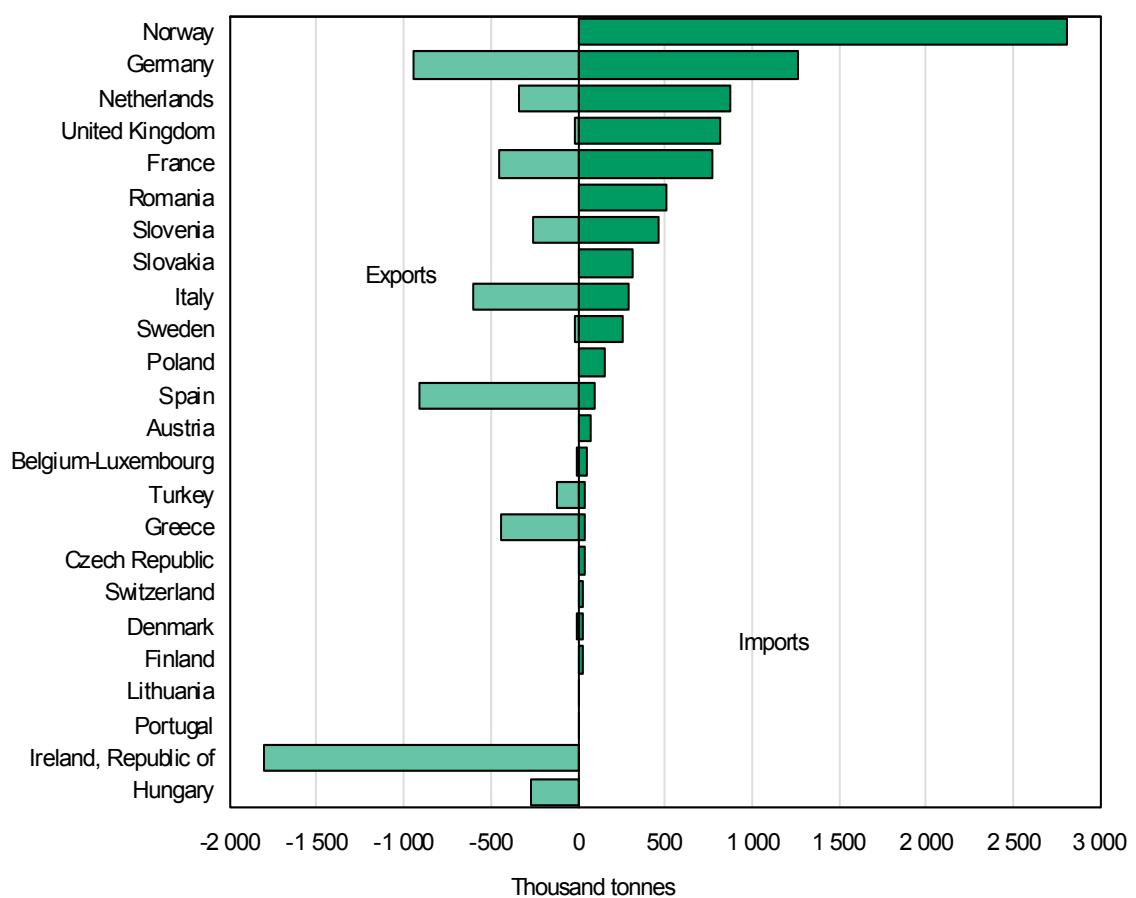

(a) Including alloys

Aluminium and Bauxite

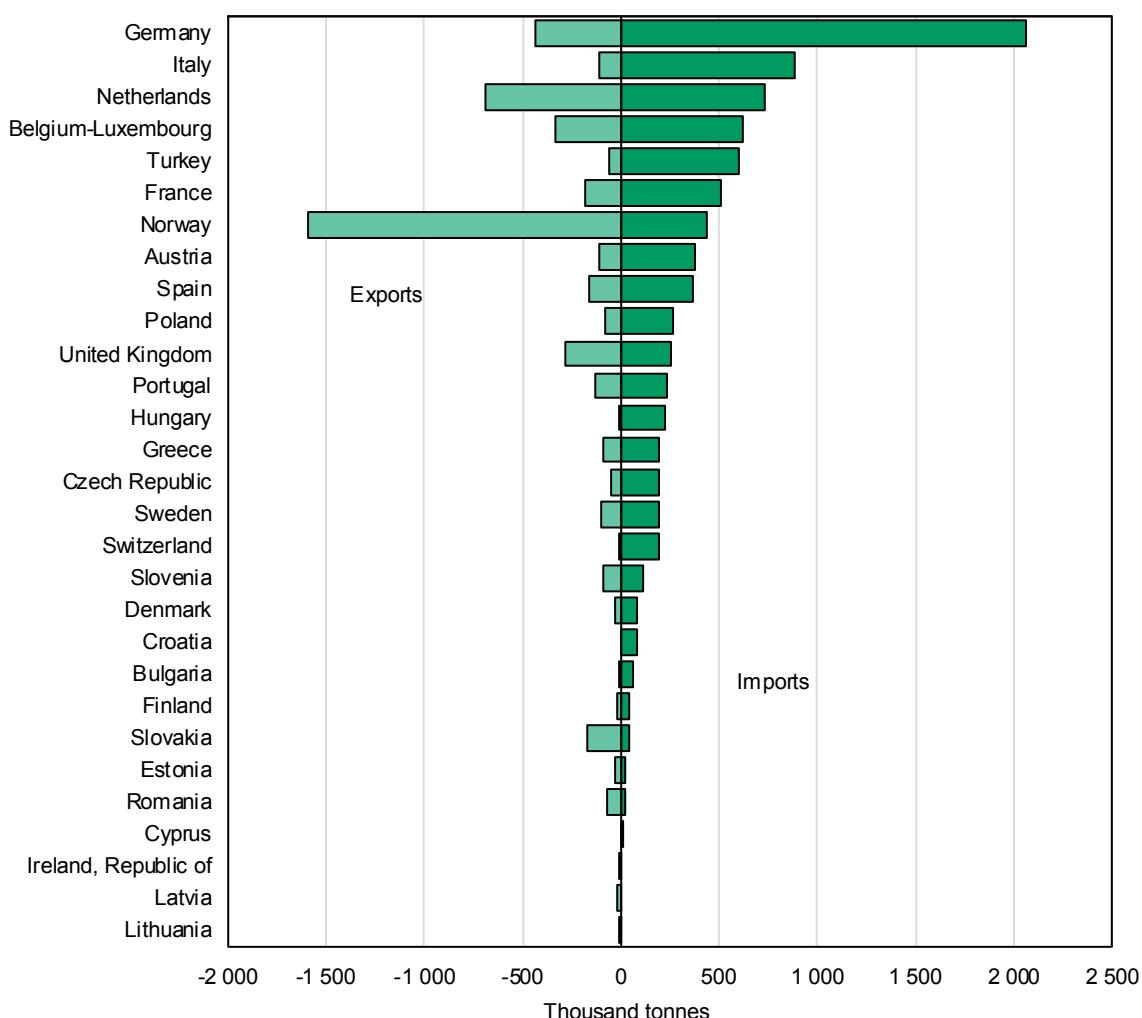

Bauxite - EU32 trade in 2008

Alumina and alumina hydrate - EU32 trade in 2008

Aluminium metal - EU32 trade in 2008

Antimony

- Antimony is a toxic metallic element with several specialised uses. It is frequently alloyed with lead, where it greatly increases hardness and strength. Antimony is also used in semi-conductors and its compounds form excellent flame-retardants in cable sheaths.
- China was by far the largest mine producer of antimony in 2008, with 90 per cent of world production. Antimony is also produced as a by-product of lead refining in many countries. Less than one per cent of world production of antimony is produced in the EU32.
- Antimony metal, minimum 99.65% Sb, and antimony oxide, a white powder, are the most commonly traded forms. In 2008 the price of antimony metal (free market in warehouse) rose from US\$5564–US\$5664 per tonne in January to a high of US\$6650–US\$6850 per tonne by September before falling sharply towards the end of the year. In 2009 the price reached a low in January of US\$4183–US\$4400 per tonne, but subsequently recovered to end the year in the range US\$6281–US\$6487 per tonne.

Mine production of antimony

Country	2004	2005	2006	2007	2008
Turkey	* 700	* 1 200	* 1 100	* 1 200	* 1 300

Note(s)

- (1) This table includes antimony content of antimonial lead alloys
(2) In addition, Hungary is believed to produce antimony

Arsenic

- Arsenic is a toxic semi-metallic element produced and traded chiefly as 'white arsenic' (arsenic trioxide). Its principal uses are as compounds in wood preservatives and pesticides. Gallium arsenide is used in semi-conductors whilst arsenic metal has a number of minor uses.
- China was the largest producer of white arsenic in 2008 and is estimated to produce more than half of world output.
- In 2008 the price of metallic arsenic dropped from the range US\$0.83–US\$0.88 per pound to the range US\$0.65–US\$0.70 per pound. In 2009 it dropped slightly further to the range US\$0.60–US\$0.65 per pound but subsequently remained constant.

Asbestos

- Asbestos is a commercial term for six fibrous minerals of which chrysotile (white asbestos), the fibrous form of serpentine, is the only form of asbestos now worked. Asbestos was once highly sought after because of its unique combination of properties:
 - non-combustibility
 - resistance to heat, friction, corrosion and acid/alkali attack
 - good thermal and sound insulation qualities
 - good dielectric properties
- Airborne asbestos fibres are a serious hazard to health and virtually all industrial use of asbestos has now ceased in Europe, together with almost all production in the EU32. The largest producer in the world is Russia with 46 per cent of world production followed by China with 17 per cent of world production.
- The price of asbestos (U.S. chrysotile imports) was about US\$746 per tonne in 2008, an increase of 58 per cent compared to 2007. However during 2009 the price dropped by 18 per cent to US\$613 per tonne.

Asbestos - EU32 trade in 2008

Barytes

- Barytes (barium sulphate) is used in a variety of industries that utilise its properties of high specific gravity, softness, non-abrasiveness, chemical neutrality and brightness. About 88 per cent of barytes production is used in the manufacture and utilisation of drilling fluids in oil and gas exploration.
- The EU32 countries contributed nearly 3.6 per cent of world barytes production in 2008. The largest producer amongst the EU32 is Turkey, which produced more than a 43 per cent of the EU32 production. The largest world producer is China, which accounted for 52 per cent of world production in 2008.
- Two main grades of barytes are traded on world markets: paint grade (min. 99%) and drilling fluid grade (min. 95%). In 2008 and 2009 the price for paint grade barytes (ground, white, 96–98% BaSO₄, 325–35 mesh, ex-works USA) remained constant at US\$275–US\$325 per short ton. The price for drilling fluid grade barytes (ground, SG 4.22, bagged, F.O.B. Morocco) started 2008 at US\$110 per tonne but increased in March 2009 to the range US\$120–US\$128 per tonne, where it remained for the rest of the year.

Barytes - EU32 trade in 2008

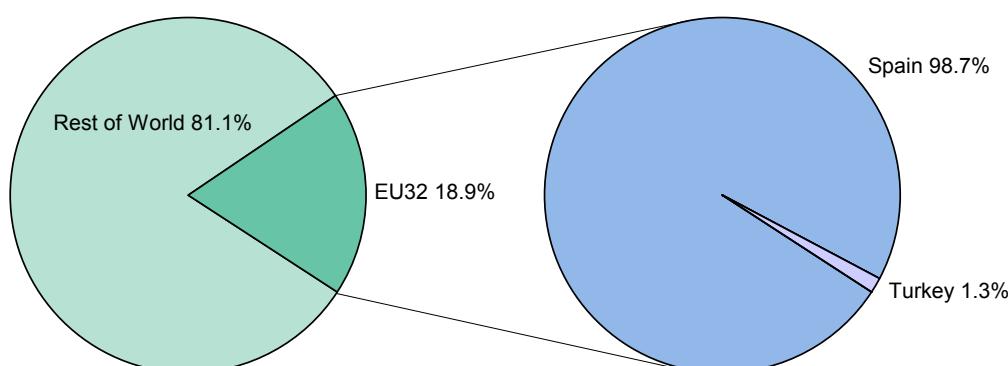

Bentonite and fullers earth

- Bentonites consist of montmorillonite (a clay mineral) that occurs as two main varieties — calcium bentonite and the more commercially important sodium bentonite. In the UK the name fuller's earth is given to calcium bentonite (and in the USA, attapulgite). Sepiolite is a fibrous clay that can be a substitute for bentonite. Calcium bentonite can be changed to sodium bentonite by the ion-exchange process. The main uses of bentonite and fuller's earth take advantage of their natural sorptive and thixotropic properties. They are used as additions to drilling muds, in making foundry moulds, pelletising iron ore and in the manufacture of cat litter.
- The EU32 countries produced 25 per cent of world bentonite in 2008. The world's largest producer was the USA with 31 per cent of world production. Greece is the largest producer of bentonite in the EU32 with a 39 per cent of EU32 production. UK production of fuller's earth ceased in 2005 and there is no longer any significant production in the EU32. Nearly 90 per cent of world production now comes from the USA. Most of Europe's sepiolite production in 2008 came from Spain, with a smaller (estimated) contribution from Turkey.
- Bentonite is traded in a variety of forms. For example, cat litter grade traded at US\$36–US\$38 per tonne during 2008 and the first part of 2009, but the range widened to US\$34–US\$38 per tonne later in 2009.

Note(s)

- (1) See notes 1-3 to production table
- (2) The figures in this table refer to natural and sodium-exchanged bentonite, and fuller's earth, Harmonised System 2508.10 and 2508.20
- (3) Activated bentonite and fuller's earth, Harmonised System 3802.90, are excluded
- (4) Some countries are believed to include sodium-exchanged bentonite, often referred to as activated bentonite, under Harmonised System 3802.90, e.g. Italy, but these are not included in this table
- (5) From 2007 Harmonised System 2508.20, used in this table for fuller's earth, is no longer available

Bentonite and Sepiolite - EU32 trade in 2008

Bismuth

- Bismuth is a metallic element, chiefly used in its compound form, in pharmaceuticals and as metal in fusible (low-melting) alloys. It is also highly valued as a substitute for lead.
- China, Mexico and Peru are the world's largest producers of bismuth, with 79 per cent of world production in 2008 coming from these three countries. There is very little mine production in the EU32, although, bismuth is produced as a by-product of lead and zinc refining.
- The price of bismuth in 2008 increased to a high of US\$16.25–US\$17.25 per pound in April before falling to end the year at US\$8.50–US\$10.25 per pound. In 2009, the price continued to fall reaching a low of US\$5.90–US\$7.70 per pound in July and August. It then recovered to US\$8.70–US\$9.70 per pound in September before falling back to end 2009 at US\$7.25–US\$8.00 per pound.

tonnes (metal content)

Country	2004	2005	2006	2007	2008
Bulgaria	* 40	* 40	* 45	* 45	* 45
Romania	* 40	* 40	* 40	* 40	* 40
EU32 Total	80	80	85	85	85

Note(s)

- (1) The figures in this table are in some instances derived from reported bismuth content of refined and impure metal plus recoverable in ores and concentrates exported
- (2) Production for some countries may include bismuth produced from imported ores but it is thought that any resulting duplication is insignificant in the countries shown

Bromine

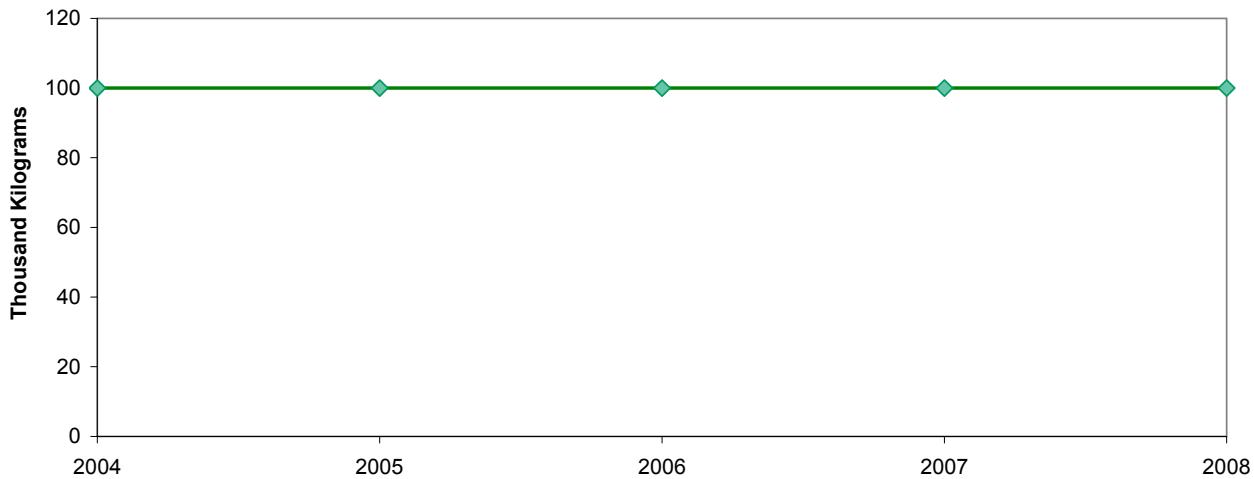

- Bromine is the only non-metallic element that is liquid at room temperature. It is strongly reactive and hazardous in pure forms and has a wide range of uses including medicines, fumigants, dyes, and pesticides.
- Bromine is almost entirely produced from processing sea-water. The two largest producers are the USA (42 per cent) and Israel (30 per cent), the latter taking advantage of the relatively high bromine content of the Dead Sea.
- Recent price information is not available.

(a) May include some fluorine

Cadmium

- Cadmium is a highly toxic metallic element mostly produced as a by-product of zinc refining. The bulk of cadmium in use is in nickel-cadmium (NiCd) rechargeable batteries. Other major uses are in pigments and in metal coatings.
- The three largest world producers in 2008 were China (23 per cent of the world total), the Republic of Korea (16.5 per cent) and Japan (11 per cent). The EU32 contributed 11 per cent of world production in 2008. Poland was the largest EU32 producer accounting for about 29 per cent of EU32 production, followed by the Netherlands (23 per cent) and Germany (20 per cent).
- Prices for cadmium metal (min. 99.95% Cd) began 2008 at US\$3.25–US\$3.50 per pound but fell sharply as the recession took hold later in the year, finishing at US\$0.63–US\$0.90 per pound. During 2009 the price recovered to some extent, despite a drop in April, and ended the year at US\$1.30–US\$1.45 per pound.

Cadmium metal - EU32 trade in 2008

Cement

- Cement is a manufactured product and is the essential basis of concrete and mortar. Its chief raw materials are limestone or chalk and clay or mudstone. In Europe it is the largest use of limestone after crushed rock aggregate.
- Cement is made by firing a mixture of limestone and clay in a kiln to produce 'cement clinker'. This is a mixture of calcium silicates and calcium aluminates, which is finely ground with the addition of five per cent gypsum/anhydrite to produce finished cement.
- Turkey was the largest producer of cement clinker in the EU32 during 2008, with 26 per cent of EU32 production. Italy is normally also a significant producer but accurate data are difficult to obtain. Turkey is also the largest producer of finished cement with 17 per cent of the EU32 total. There is significant international trade in both clinker and finished cement.

Cement - EU32 trade in 2008

Chromium ores and concentrates

- Chromium is a hard metallic element that is an essential component of stainless steel and other alloy steels, where it is used in the form of the alloy ferro-chromium. It is also used extensively in superalloys and metal plating. Its compounds are important pigments and the natural mineral chromite is used in refractories.
- World production of chromium ores and concentrates is dominated by South Africa, India and Kazakhstan which together produced 73 per cent of the world total in 2008. Finland and Turkey are the only countries in Europe with significant production, which amounted to nearly 11 per cent of the world total.
- The price of chromium ore (South African, metallurgical grade, C.I.F. Chinese ports), in August 2008, was in the range US\$330–US\$350 per tonne. However, like many metals, the price fell later in 2008 due to the global recession and it ended the year at US\$160–US\$180 per tonne. During the early part of 2009, the price fell further reaching a low of US\$80–US\$100 in May before recovering to US\$180–US\$200 per tonne by the end of the year.
- The price of chromium metal (alumino-thermic, min. 99% in warehouse) increased during the first part of 2008 from its starting position of US\$9200–US\$9500 per tonne to reach a high in August of US\$13 500–US\$14 000 per tonne. During the latter part of 2008 and early 2009 the price fell sharply to a low of US\$7600–US\$8000 per tonne by April. The price experienced only a slight recovery throughout the rest of 2009 and ended the year at US\$8100–US\$8350 per tonne.

Chromium ores and concentrates - EU32 trade in 2008

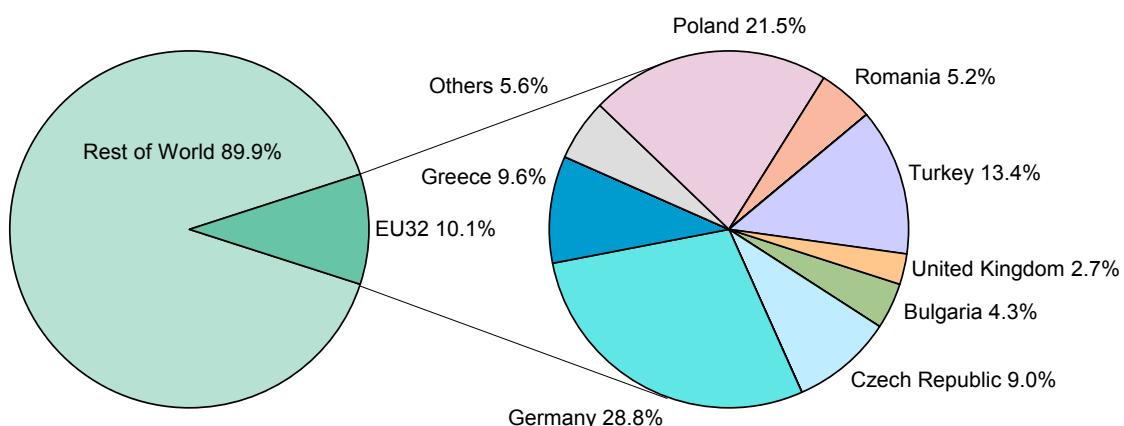

Chromium

Chromium metal - EU32 trade in 2008

Coal

- Coal is a combustible rock, composed of lithified plant remains. It is an important source of energy throughout the world.
- Coal has two predominant end uses. Steam coal (or thermal coal) is burnt in power stations for electricity generation and is also used for other domestic and industrial purposes. Coking coal, which commands a higher price, is used in the steel industry to de-oxidise iron ore in the blast furnace. Both black coal (anthracite and bituminous) and brown coal (lignite) are used as steam coal; only bituminous coal is used as coking coal.
- In 2008 the EU32 countries produced 10 per cent of the world's coal (all types) of which approximately half was contributed by Germany and Poland. China, the world's largest coal producer, has seen an increase in production of 34 per cent between 2004 and 2008, and now accounts for nearly 40 per cent of the world total.
- The pricing of coal is complex, based on coal type, net calorific value and content of impurities such as sulphur. The Global Coal RB Index gave a price for coal in December 2009 of US\$77.56 per tonne.

Note(s)

(1) There is no international agreement as to the separate definition of lignite and brown coal. In some cases they are distinguished.
Elsewhere both may be aggregated under one or other term

- (a) Coal; all forms
- (b) Spitzbergen: not including production from mines controlled by Russia
- (c) Including anthracite

Coal

Coal - EU32 trade in 2008

Cobalt

- Cobalt is a lustrous, greyish-silver, brittle metal. It is also very hard and can take a high polish. It retains its strength at high temperatures and is ferromagnetic, which means it is capable of being magnetised. Cobalt is extensively used as an alloying metal and is valued for its ability to produce very hard superalloys with useful magnetic properties and resistance to high temperatures. It is also used in the manufacture of chemical compounds for a wide range of industrial uses, in rechargeable batteries and as a pigment in glass, enamels, pottery and china.
- Democratic Republic of Congo was the largest world producer of mined cobalt in 2008, with 48 per cent of the world total. Canada, Australia, Brazil, Zambia and Cuba also produced between five and nine per cent each. There was no mine production within the EU32.
- China was the world's largest producer of cobalt metal, producing 32.5 per cent of the world total in 2008. Finland was the second largest world producer, with 17 per cent. Altogether, the EU32 contributed 29 per cent to the world's total output of cobalt metal.
- Cobalt prices have long been volatile. Average prices in 2008 were 30 per cent higher than the previous year, despite the monthly average price for December 2008 having dropped by 60 per cent year-on-year to US\$14.5 per pound. During 2009 prices gradually increased driven by high demand, although they remained highly volatile, and finished the year at around US\$20 per pound.

Cobalt

Cobalt - EU32 trade in 2008

Copper

- Copper is reddish, malleable and ductile metallic element with excellent thermal and electrical conductive qualities. It is a very important industrial material and is used in the electrical, electronics, transportation and construction industries.
- World mine production in 2008 was dominated by Chile (34 per cent) although many countries have some form of copper production. Chile (17 per cent of total) was also the second largest refined copper producer in the world after China (21 per cent). The EU32 countries contributed five per cent to the world mined copper total and 15 per cent to world refined copper production. Poland was the largest mine producer in the EU32 and second largest refined metal producer, after Germany where refined copper production is based on imported materials.
- Following the all-time record high copper price of US\$8985 per tonne attained in July 2008, prices declined sharply over the remainder of the year in response to the deteriorating global economic climate. By December prices had fallen below US\$3000 per tonne, the lowest price since September 2004 and a fall of around 69 per cent from the July 2008 peak. Throughout 2009 the copper price generally recovered, albeit with some considerable fluctuation, to end the year above US\$7300 per tonne. However, the average annual price for 2009 was approximately US\$5200 per tonne, around 25 per cent lower than for 2008.

Note(s)

- (1) In this table the term 'unwrought' copper corresponds to items 7402, 7403, 7405 of the Harmonised System and includes both unrefined (including blister) and refined copper
- (2) The term 'unwrought' as used here includes alloys unless these are separately specified. The term 'scrap' includes scrap alloys

- (2) The term 'unwrought' as used here includes alloys unless these are separately specified. The term 'scrap' includes scrap alloys

Copper

Copper - EU32 trade in 2008

Diamond

- Diamond is a polymorph of carbon and is the hardest substance known. It is used mainly in jewellery, abrasives and cutting tools.
- Africa (chiefly Democratic Republic of Congo, Botswana and South Africa) dominates world production with 58 per cent of all carats produced in 2008. However, Russia is the world's largest producing country (22 per cent of world production). Australia and Canada are also significant diamond producers. There is no mine production of diamond in the EU32 but production of synthetic diamonds is important and Europe is a world centre for diamond trading.
- Gem quality diamonds are valued on an individual basis that takes into account their unique qualities and are seldom priced at less than US\$1000 per carat. Rough (i.e. uncut) diamonds typically average between US\$72 to US\$84 per carat. Prices for Industrial diamonds, which are predominantly synthetic, are typically about US\$10 per carat.

- (3) In this table the term 'Dust' corresponds to item 7105.10 of the Harmonised System and includes both natural and synthetic diamond dust

Diatomite

- Diatomite is a siliceous sedimentary rock composed of the skeletons of fossilised diatoms (microscopic plants). Clay content of the rock has a strong control on the quality of the diatomite. Diatomite is valued for its high porosity, chemical inertness and ability to absorb liquids. It is used in industry within high-quality filters, as a filler and as an industrial absorbent
- The USA is the largest producer of diatomite, with 33 per cent of the world production, despite a five per cent reduction in output in 2008 compared to 2007. This was more than offset by a 54 per cent increase in production from Mexico. EU32 production amounted to 17 per cent of world production in 2008. Production in the EU32 countries is dominated by Denmark, which produces 62.5 per cent of EU32 output, although this is moler, an impure diatomite.
- Diatomite (US calcined filter-aids delivered to the UK) traded between £370 per tonne and £410 per tonne throughout 2008 and continued at the same rate until April 2009 when they increased to between £380 per tonne and £420 per tonne.

Diatomite - EU32 trade in 2008

Feldspar

- Feldspar is an abundant rock-forming alumino-silicate mineral. It is an essential component of glass and ceramic manufacture where it behaves as a flux and adds hardness, durability and resistance to corrosion.
- Turkey is the largest world producer (26 per cent of the world total) and Italy is the second largest world producer (22 per cent). Together, the EU32 countries accounted for 62 per cent of world feldspar production in 2008.
- Feldspar is traded in several forms and prices appear to be stable, for example Turkish crude was priced between US\$22–US\$23 per tonne throughout all of 2008 and 2009, while glass grade -500 microns was priced at US\$70 per tonne.

Feldspar - EU32 trade in 2008

Fluorspar

- Fluorspar is the commercial name for the mineral fluorite (calcium fluoride) and it is an important raw material source of fluorine. Most fluorspar production is used in the manufacture of hydrofluoric acid which is used primarily in the pharmaceutical and agrichemical industries. Fluorspar is also used in steel and aluminium manufacture.
- China dominated world production, producing 53 per cent of all fluorspar in 2008. The EU32 countries represent four per cent of world fluorspar production, but there has been a reduction in output of 31 per cent between 2004 and 2008 due, in part, to the cessation of output from France and Italy. Spain was the largest EU32 producer with 63 per cent of EU32 production in 2008, despite a fall in output of nearly six per cent compared to 2007.
- During 2008 the price for Chinese acidspar filtercake (C.I.F. Rotterdam) increased from a starting point of US\$340–US\$350 per tonne to US\$530–US\$570 per tonne by September. It remained at a similar level until June 2009, when the price fell sharply to US\$350–US\$380 per tonne. It fell further, although less dramatically, during the latter part of 2009 to end the year at US\$310–US\$340 per tonne.

Fluorspar - EU32 trade in 2008

Gold

- Gold is a soft, malleable metallic element unaffected by air or most reagents. It is highly valued as an investment commodity, in jewellery and in specialist electronic applications.
- China, the USA, Australia and South Africa were the four largest gold producers in 2008, although China was the only one of these where production increased in 2008 compared to 2007. Together these four countries produced 41 per cent of the total world output. In the EU32 Turkey (41 per cent of the EU32 total) and Sweden (20 per cent) were the largest producers in 2008, although the EU32 countries produced only one per cent of world output in 2008.
- The gold price can be volatile but has strengthened considerably in recent years due to declining mine output, increasing jewellery demand, speculative activity, devaluation of the US dollar and other factors. The gold price rose above US\$1000 per troy ounce for the first time in March 2008 in response to a weak US dollar and rising oil prices, although it dropped back later in the year and finished 2008 at US\$880 per troy ounce. In 2009 the price of gold experienced a generally upward trend, albeit with some significant fluctuations, and remained above US\$1000 per troy ounce from October to the end of the year when it finished at around US\$1100 per troy ounce.

Note(s)

- (1) In this table the term 'metal' includes both unwrought and partly worked gold but excludes gold coin
 (2) Kilograms have been used as the unit in this table except where the only obtainable figure is the value. In these cases the national currency figure has been converted to £ sterling
 (3) See explanatory notes at the front of the volume regarding currency conversions

(a) BGS estimates, based on known exports from certain countries

Graphite

- Graphite is a stable form of pure carbon. It is soft, has low friction and is inert. The major use of graphite is in refractories that can withstand the temperature of molten metals and slags. The graphite imparts high thermal shock resistance, useful in furnace components and crucibles. Other uses include lubricants and in brake linings.
- Production in the EU32 countries rose slightly in 2008 compared to 2007, but was still 43 per cent lower than in 2006 and represents less than one per cent of the world total. World output is dominated by China which produced 86 per cent of the total.
- Graphite is traded in several different forms with prices depending largely on flake size. During 2008 and 2009 graphite traded between US\$450 and US\$1350 per tonne.

Note(s)

(1) This table excludes synthetic graphite

Graphite - EU32 trade in 2008

Gypsum

- Gypsum (calcium sulphate) is a common mineral that chiefly occurs as beds or seams in sedimentary rocks. Anhydrite is a similar mineral without combined water and is considered in the following tables with gypsum. Calcined gypsum is chiefly used (80 per cent) to make building and decorative plaster. It is used as an additive to cement, in farming as a soil conditioner, as a filler and in the chemical industry.
- The EU32 produced nearly 22 per cent of world natural gypsum in 2008. The largest EU32 producer is Spain which accounted for 49 per cent of EU32 production (or 11 per cent of the world total). China was the largest gypsum producer in the world in 2008 with 25 per cent of the world total.
- The overall trade situation with gypsum is becoming difficult to follow as large quantities of synthetic gypsum are made during the desulphurisation of coal-fired power station fumes and this competes with natural gypsum production.
- The price of crude gypsum (ex-mine US) averaged US\$8.70 per tonne in 2008 and US\$8.50 per tonne in 2009.

Gypsum

Gypsum - EU32 trade in 2008

Iodine

- Iodine is a bluish-black lustrous, solid, non-metal with antiseptic and other medicinal properties, used in sanitation, animal feed and pharmaceutical products. It is also a catalyst.
- World production is dominated by Chile (56 per cent). The EU32 produces no iodine.
- Prices for crude iodine crystals (drums, 99.5% min) tend to be stable for several months at a time. In 2008 prices started at US\$25.00 per kilogram and increased to US\$28.00–US\$30.00 per kilogram in October. The price increased further in February 2009 to US\$30.80–US\$32.00 per kilogram but then remained relatively constant for the rest of the year.

Iron ore

- There are two main commercial ores of iron — magnetite and haematite (both iron oxides). Iron is also recovered from pyrites (FeS_2). Iron ore is mined, processed and smelted chiefly to produce steel in integrated steel plants. Pig iron, for use as iron, is a minor part of production.
- The largest world producer in 2008 was China (38 per cent of the world total) where output has increased by 166 per cent since 2004. EU32 iron ore production was only 1.4 per cent of the world total in 2008 and has increased by only six per cent since 2004. Sweden is the largest EU32 producer (76 per cent of EU32 production).
- Iron ore trade is characterised by consumers having fixed contracts with producers, which are negotiated annually. However, price volatility and a failure by producers to fix a contract price with China in 2009 led to a record amount of ore being traded on the spot market. Iron ore prices remained high (above US\$200 per tonne) until September 2008 after which they dropped sharply to end the year at around US\$100 per tonne. The price has remained volatile throughout 2009, heavily dependant on demand from China and India, and price increases have been modest.

Note(s)

(1) The data in this table include sponge iron and direct reduced iron (DRI), where these have been separately identified

Crude steel

- Crude steel is the end result of smelting iron ore. It is produced in a wide variety of forms including slabs, coils, bars, rods and plates — depending on customer requirements. Steel is a ubiquitous product and has a multitude of applications. Alloying with other metals changes the fundamental properties of crude steel to meet specialised requirements. Recycled, or secondary, steel is a significant part of EU32 and world total steel production.
- The majority of industrialised countries produce steel. In 2008 the largest producer was China, with 38 per cent of the world total and with production 77 per cent higher than in 2004. The EU32 countries produced 17 per cent of the world total and the largest producer in the EU32 was Germany, which produced 20 per cent of EU32 steel output.
- Prices for hot-rolled coil steel increased during the first half of 2008 to about US\$1100 per tonne, however once the global economic conditions started to take effect the price dropped, finishing the year at about US\$500 per tonne. It dropped further during the early part of 2009, to a low of US\$430 per tonne in July, before recovering, to some extent, to the end of the year at US\$560 per tonne.

- (1) Unless otherwise indicated, these figures include production from scrap
(2) Small amounts of steel are believed to be produced in Estonia and Lithuania

EU32 Production of crude steel 2004 - 08

Ferro-alloys

- Ferro-alloys are alloys with iron of a number of metals used exclusively as additives to steel with the object of modifying its properties. Silicon metal is included within the ferro-alloys table as it is used for the same purpose.
- Ferro-alloy production is usually undertaken close to the mine site or at distant locations where cheap energy supplies are available.
- China is the largest world producer but in the EU32, Norway is the largest producer based on imported metal ores and indigenous resources of silica.

Note(s)

(1) In this table the term 'ingots, blooms, billets' corresponds to items 7206, 7207, 7218 and 7224 of the Harmonised System which includes those of alloy and high carbon steel

(a) Included with 'other ferro-alloys'

Iron and steel ingots, blooms and billets - EU32 trade in 2008**Iron and steel scrap - EU32 trade in 2008**

Kaolin

- Kaolin is the market name for the clay mineral kaolinite. Unlike ceramic and refractory clays, kaolinite is usually processed to eliminate impurities and to tailor the product for end-use. Kaolin has many industrial applications: the main ones are in the manufacture of paper, ceramics, rubber, plastics, paint, cement and glass-fibres. Paper manufacture is the largest end-use of kaolin, up to 30 per cent of printing paper can be kaolin.
- Kaolin production is fairly stable in the EU32 countries, which in 2008 produced 28 per cent of world kaolin. Germany and the UK are the two largest producers in the EU32 and are the second and fifth biggest producers in the world, respectively. The USA was the world's largest producer in 2008, with 25 per cent of the total.
- Kaolin is traded in several different forms; throughout 2008 and 2009 Brazilian paper-coating grade traded in the range US\$170 per tonne to US\$215 per tonne.

Kaolin - EU32 trade in 2008

Lead

- Lead is a very soft, highly malleable, ductile metallic element with low electrical conductivity. It is also very dense and strongly resistant to corrosion, although it tarnishes rapidly in air. The main use is in lead-acid batteries, although lead is also widely used in architecture, plumbing, ordinance, solder, radiation shielding and insecticides.
- China was the world's largest mine producer in 2008 (with 39 per cent of the total) and refiner of lead (with 34 per cent of the total). In the EU32 the largest mine producer of lead was Sweden (24 per cent of the EU32 total), followed by Poland (23 per cent) and the Republic of Ireland (19 per cent). The largest producers of refined lead, based on imported materials and recycling, were Germany (25 per cent) and the UK (17 per cent). It is estimated that worldwide more than 50 per cent of refined lead produced is from recycled material.
- During 2008, the London Metal Exchange (LME) price for lead (cash, monthly average) increased to a high of US\$3079 per tonne in February but generally decreased thereafter to end 2008 at US\$962 per tonne. Prices more than doubled over the course of 2009; rising from around US\$1000 per tonne in January 2009 to around the US\$2400 per tonne by the end of the year.

Note(s)

- (1) In this table the term 'unwrought' lead corresponds to item 7801 of the Harmonised System and comprises base bullion, pigs, unwrought bars, etc.
- (2) The term 'unwrought' as used here includes alloys unless these are separately specified

(a) Complex lead-zinc ore

Note(s)

- (1) In this table the term 'unwrought' lead corresponds to item 7801 of the Harmonised System and comprises base bullion, pigs, unwrought bars, etc.
- (2) The term 'unwrought' as used here includes alloys unless these are separately specified

(a) Includes a substantial precious metal content, mainly silver

Lead ore - EU32 trade in 2008**Lead - EU32 trade in 2008**

Lithium minerals

- Lithium is a very light metallic element. It is mainly used as lithium compounds that act as fluxes in the ceramics and glass industries, and in lubricants. The metal is an important alloying agent in primary aluminium. Lithium is increasingly being used in rechargeable batteries.
- Lithium is produced in only a few countries of which Australia was the largest lithium mineral producer in 2008 (approximately 56 per cent of world production of lithium minerals). Chile was the largest producer by lithium content (52 per cent of world production). In the EU32 Portugal and Spain are the only countries producing lithium minerals.
- The lithium minerals spodumene and petalite, with lithium carbonate, are the usual traded forms. Prices were stable throughout 2008 and 2009 with spodumene concentrate (>7.25% Li₂O, F.O.T. Amsterdam) trading in the range US\$680 per tonne to US\$750 per tonne and lithium carbonate (USA large contracts) trading between US\$2.70 per pound and US\$3.00 per pound.

Magnesite

- Magnesite is the commonly used name for magnesium carbonate rock. Magnesite has excellent thermal resistance and is most commonly used as refractory bricks in furnaces. It is also used in fertilisers.
- Economic deposits of magnesite are rare. China was the largest world producer in 2008, with an estimated 57 per cent of world production. The largest EU32 producer was Turkey with 39 per cent of EU32 production (and nine per cent of the world total).
- In 2008, Chinese dead burned 90% MgO, F.O.B. increased from US\$255 per tonne in January to a high of US\$550–US\$575 per tonne by November. Prices started to fall in December 2008 and continued downwards in early 2009 to reach a low of US\$300–US\$320 per tonne in April before recovering to US\$320–US\$360 per tonne by the year end.

Magnesite and magnesia - EU32 trade in 2008

Manganese ore

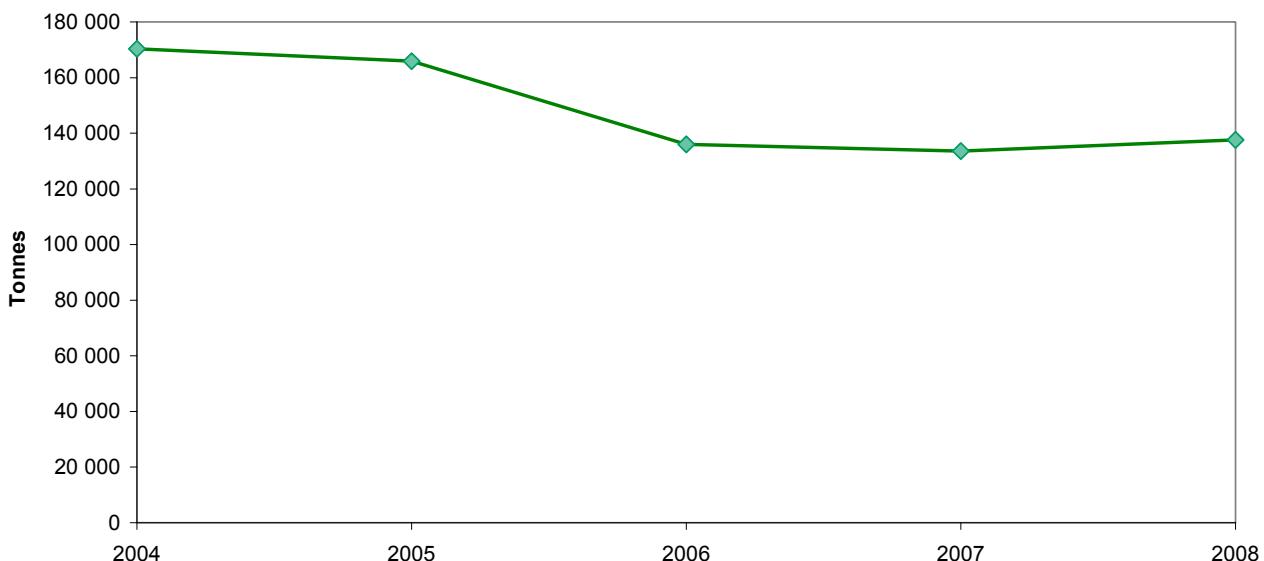

- Manganese is a hard, brittle metal. The chief ores are pyrolusite and other manganese dioxides. The principal use is in the steel industry as a desulphuriser and an alloying agent, where it imparts hardness and wears resistance. Manganese is also an important constituent of many aluminium alloys. Manganese dioxide is a component of dry-cell batteries; other compounds are used in the chemical industry.
- Economic concentrations of manganese are relatively rare. China was the largest producer in 2008 with an estimated 33 per cent of world production. Production of manganese in the EU32 is limited, with Hungary (37 per cent of EU32 production) the largest producer. Manganese ore, ferro-manganese, electrolytic manganese dioxide and manganese metal are the chief forms in international trade.
- Prices for manganese ore (48-50% Mn) increased during the early part of 2008 from US\$6.50-US\$8.00 per tonne to a high of US\$17.00-US\$18.00 per tonne by September. The price then fell dramatically, and continued to fall into 2009, reaching a low of US\$3.00-US\$4.00 per tonne by June. A slight recovery towards the end of 2009 saw the price finish the year at US\$5.90-US\$6.90 per tonne.

Mercury

- Mercury is the only metallic element that is liquid at room temperature. The chief economic sources are deposits of the mineral cinnabar but mercury is also recovered from base metal refining. Mercury's main uses are in electrical switches and other control apparatus, and in dental amalgam. Large amounts remain in use in chlor-alkali plants and in batteries but these applications are being phased out.
- Only nine countries commercially extracted mercury in 2008. China and Kyrgyzstan are the world's two largest producers and are together responsible for 77 per cent of total world output. Mexico is now the third largest world producer because their output in 2008 increased by 172 per cent compared to 2007. Finland is the only producer in the EU32 countries and its output represents three per cent of the world total.
- Mercury prices (free market, in warehouse) remained stable throughout much of 2008 at US\$500–US\$600 per flask, before rising to US\$600–US\$700 per flask by the end of the year. Prices then remained at this level until August 2009 before falling back to US\$500–US\$600 per flask by October 2009.

Mercury - EU32 trade in 2008

Mica

- Micas are a group of chemically complex rock-forming minerals recognisable by a perfect cleavage (i.e. they are naturally flaky). Sheet mica is used predominantly in electrical insulation and ground mica has a very wide variety of uses including filler, dusting agent, absorbent, fire insulator, strength enhancer in plastics and decorative material.
- Although a very common mineral, commercial concentrations of mica are relatively rare. China was the largest world producer in 2008 with 37 per cent of the world total. Mica is produced in three EU32 countries, of which the largest producer is France (57 per cent of EU32 total). Altogether, output from the EU32 countries represents nine per cent of the world total.
- Because of the wide variety of micas there are many trading categories that are very sensitive to quality but generally stable in price. For example, USA micronized mica traded in the range US\$700 per tonne to US\$1000 per tonne throughout 2008 and 2009.

Note(s)

(1) This table shows unmanufactured mica and includes sheet, block, splittings, ground and waste, unless these are separately specified.
Mica powder is included under the term 'ground'

(a) Including unmanufactured

Molybdenum

- Molybdenum is a hard metal. It is an important component of high tensile steel where it imparts hardness, tolerance of high temperatures and resistance to corrosion. Molybdenum disulphide is used as a dry lubricant.
- Molybdenum is generally produced as a by-product of copper mining. Production in 2008 was confined to only 14 countries, of which the three largest producers, China, the USA and Chile, together produced 79 per cent. There is no production in the EU32 countries.
- Molybdenum is marketed mainly as concentrate, oxide and ferro-molybdenum. Throughout much of 2008 the price for molybdenum oxide (drummed, free market, in warehouse) was relatively stable, ranging between US\$33.02–US\$34.33 per pound. However in the last three months of 2008 there was a dramatic fall in price to end the year at only US\$9.90–US\$10.52 per pound. The price fell further during the first part of 2009, reaching a low of US\$7.91–US\$8.50 per pound in April, before recovering to US\$17.69–US\$18.29 per pound in August. However, the price then fell again to end the year at US\$11.31–US\$11.83 per pound.

Note(s)

(1) Metal traded in ferro-alloy form is included under iron, steel and ferro-alloys

Nickel

- Nickel is a hard, strong, corrosion-resistant, malleable and ductile metal that is a good conductor of heat and electricity. Its most important use is in steel alloys where it imparts strength and toughness. It is also widely used in plating, both metals and plastics, and combined with copper in cupro-nickel alloys.
- About one third of world nickel mine production in 2008 was supplied by Russia and Canada. Australia overtook Indonesia to regain its position as the third largest mine nickel producer in the world. Greece is the largest mine producer in the EU32 with 40 per cent of the EU32 total followed by Macedonia (32.5 per cent of the EU32 total).
- Russia is also the largest refined nickel producer in the world and Canada is the third largest behind China. Together these three countries produced 45 per cent of the world total in 2008. Norway was the largest refined nickel producer in the EU32 in 2008 with 39 per cent of the EU32 total.
- Nickel has been one of the commodities worst hit by the worldwide economic downturn with prices falling to a low of US\$8805 per tonne during 2008, more than 600 per cent below its peak of 2007. Prices improved during 2009 due mainly to improved investment demand, Chinese imports and a recovery in the stainless steel sector. The price ended 2009 at US\$18 480 per tonne, an increase of 69 per cent since the beginning of the year.

Nickel - EU32 trade in 2008

Crude petroleum

- Petroleum ('oil') is a fundamental energy resource and raw material for lubricants, olefins, polymers (plastics) and other synthetic materials.
- In 2008 a world total of 3911 million tonnes of crude petroleum was produced. The largest producing country was Saudi Arabia with 13 per cent of the world total, followed by Russia (12 per cent) and the USA (eight per cent). The EU32 countries produced just 5.6 per cent of the world total with 53 per cent of this coming from Norway and 30 per cent from the UK.
- Crude oil prices (Europe Brent spot prices) continued to increase during the first part of 2008, reaching a peak in July 2008 of nearly US\$144.00 per barrel, before declining sharply to end 2008 at about US\$36.00 per barrel. During 2009 spot prices displayed a generally increasing trend, although at a slower rate than early 2008, and reached nearly US\$78.00 per barrel by the end of the year.

Crude petroleum - EU32 trade in 2008

Natural gas

- Natural gas is an increasingly important fundamental energy resource. It is used chiefly as a fuel but also a basic feedstock for chemicals such as propane and butane, and in the manufacture of ammonia and fertilisers. It is transported either by pipeline, often over transcontinental distances, or by ships in the form of liquefied natural gas (LNG).
- In 2008 a total of 3 155 000 million cubic metres of gas was produced in the world. Russia (21 per cent) and the USA (18 per cent) are the largest world producers. The EU32 countries contributed 10 per cent to the world total, with 31 per cent of this coming from Norway, 25 per cent from the Netherlands and 24 per cent from the UK.
- The price of natural gas (European Union CIF) averaged US\$12.61 per million Btu (British thermal unit) in 2008, a 41 per cent rise on 2007.

Phosphates

Phosphate rock

- Phosphate rock is the term given to a range of phosphorus-bearing minerals that are commercially exploited. Over 90 per cent of phosphate rock is used to produce fertilisers. The remainder is used in the manufacture of detergents, animal feedstock and many other minor applications.
- China, the USA and Morocco are the world's largest producers and together the output from these countries represents 64 per cent of the world's phosphate rock. Finland is the only producer in the EU32, which is otherwise dependent on imports.
- Phosphate rock (USA, marketable, all grades, F.O.B. plant) averaged US\$76.76 per tonne in 2008 and US\$50.00 per tonne in 2009.

Phosphate rock - EU32 trade in 2008

Platinum group metals

- The platinum group metals (PGMs) are platinum, palladium, rhodium, ruthenium, osmium and iridium. Of these, platinum and palladium are the most commercially significant. Platinum and palladium have important applications in electronics, jewellery and as catalysts (in catalytic converters for vehicles and in many industrial processes). They are also investment commodities.
- Mine production is confined to a handful of countries. The largest producers in 2008 were South Africa (61 per cent - chiefly platinum) and Russia (28 per cent - mainly palladium). There is no EU32 mine production.
- The price of platinum continued its upward trend in the early part of 2008, to a peak of US\$2276 per troy ounce in March, before the effects of the global economic difficulties reduced the demand for vehicles and hence for platinum. The price ended 2008 at US\$912 per troy ounce. The price trend over 2009 showed a gradual but steady rise, driven by a weak US dollar, strong investor interest and a high gold price. It finished the year at US\$1476 per troy ounce, a 157 per cent increase compared to the start of 2009.
- In 2008, the price of palladium rose significantly at the start of the year to reach US\$585 per troy ounce in February but then fell sharply towards the end of the year to finish at US\$175 per troy ounce. During 2009, however, the price of palladium increased steadily to reach US\$390 per troy ounce at the end of the year, an increase of 205 per cent.

Note(s)

- (1) In this table the term 'Platinum' and/or 'Platinum metals' includes unwrought, partly worked and alloys
- (2) Kilograms have been used as the unit in this table except where the only obtainable figure is the value. In these cases the national currency figure has been converted to £ sterling
- (3) See explanatory notes at the front of the volume regarding currency conversions

Potash

- Potash is the name for a range of potassium-bearing minerals and processed chemical products. Potassium is essential in fertilisers and is widely used in the chemicals industry and in explosives.
- Economic potash deposits are rare, with only 13 countries producing potash in 2008. Canada, Russia and Belarus together generated 65 per cent of world production. The EU32 is a significant producer of potash, producing 12.5 per cent of world production in 2008. Most of this was from Germany (79 per cent of EU32 total and 10 per cent of world total).
- Prices for standard grade potash were stable at US\$240–US\$250 per tonne until July 2009 when suddenly they leapt up to US\$550–US\$600 per tonne. They remained at this level until November when they dropped back slightly to US\$500–US\$550 per tonne.

Potash - EU32 trade in 2008

Rare earth minerals

- Rare earth elements (REE), which occur chiefly in the minerals bastnaesite and monazite, are a group of 15 metallic elements of which cerium, lanthanum and neodymium are the most commonly used. Rare earths are widely used in automotive catalysts, as metallurgical additives and in glass and ceramics.
- Production of rare earths is limited to only four countries of which China is by far the largest producer (95–99 per cent). There is no EU32 production, thus Europe is entirely import dependent.
- Despite the limited production base, REE prices were remarkably stable. Throughout 2008 and 2009, bastnaesite concentrate (70 per cent leached) traded at US\$2.25 per pound rare earth oxides (REO). The price for lanthanum oxide (99 per cent) rose steadily in 2008 from a starting rate of US\$5.20 per kilogram to a high of US\$9.60 per kilogram by June, where it levelled off and then began to fall finishing the year at US\$8.50 per kilogram. In 2009 the price experienced a generally downward trend, to reach a low of US\$4.90 per kilogram in October before rising slightly to end the year at US\$5.50 per kilogram.

Salt

- Salt (sodium chloride) is a fundamental chemical of life. However, human consumption accounts for a small fraction of salt usage. Industrial use is far higher, particularly in the chemical industry as a source of soda and chlorine. Salt is also used to 'grit' roads to prevent the formation of ice between 0°C and -6°C.
- Most countries in the world have some salt production from rock salt, brine or seawater. In 2008 the largest producer was China (23 per cent). In the EU32 the largest producer was Germany (27 per cent of total EU32 production).
- Because of the wide availability of salt, markets tend to be generally stable. However, although the price of Chinese industrial solar salt started 2008 at US\$27–US\$29 per tonne, it leapt to US\$66 per tonne in August, before falling back to US\$44 per tonne by the end of the year. In 2009 the price fell further to US\$22 per tonne but then recovered in March 2009 to the range US\$27–US\$29 per tonne for the remainder of the year.

Salt - EU32 trade in 2008

Sillimanite minerals

- Sillimanite minerals are a group of three anhydrous aluminium silicate minerals (andalusite, kyanite and sillimanite) that are chiefly used as refractories. Bricks and mortar used to line furnaces and kilns usually contain a proportion of these minerals.
- Despite being common minerals in high-grade metamorphic rocks, economic concentrations of these minerals are rare. In 2008, known production was restricted to only five countries, of which South Africa was the largest producer. China is also believed to be a significant producer of sillimanite minerals. The only major producer in the EU32 is France.
- In 2008, kyanite prices, ex-works USA (54–60 per cent Al₂O₃) traded in the range US\$167–US\$309 per short ton and in 2009 they ranged from US\$211 per short ton to US\$301 per short ton.

Silver

- Silver is a ductile and malleable metallic element that has the highest electrical and thermal conductivity of all metals. It is widely used in electronics although the most important uses are in photography (silver nitrate) and making mirrors.
- Silver is more common than the other precious metals, although still much rarer than base and ferrous metals. It is rarely mined in its own right, and is chiefly produced as a by-product of lead, tin or copper mining. In 2008 the world's largest producers were Peru, Mexico and China, together accounting for 45 per cent of world production. The largest EU32 producer was Poland (58 per cent of EU32 production and five per cent of world production).
- The first three months of 2008 saw the price increase sharply to US\$19.51 per troy ounce although this dropped back over the following three months. A second peak of US\$18.03 per troy ounce in July was followed by a significant drop to a low of US\$9.87 per troy ounce in November. Despite this, the average for 2008 was US\$15.02 per troy ounce. During 2009 the price for silver has generally increased from US\$11.29 per troy ounce at the start of the year to US\$17.79 per troy ounce at the end of the year, averaging US\$14.89 per troy ounce over the year as a whole.

(a) BGS estimates, based on known exports from certain countries

Sulphur and pyrites

- Sulphur is one of the fundamental feedstocks to the chemical industry, usually as sulphuric acid. The chief sources of sulphur are petroleum refining, natural gas, base metal sulphide processing and pyrites (iron sulphide).
- Most industrialised countries in the world have some sulphur production. The largest producers of recovered sulphur in 2008 were Canada and USA (both 14 per cent of world total) and the largest world producer of pyrites and sulphur ore was China. In the EU32 the largest producer was Germany (19.5 per cent of EU32 production).
- In 2008 sulphur prices increased dramatically as a result of reduced production in the USA and problems at other refineries. The price peaked in August 2008 at about US\$600 per tonne, but subsequently fell to about US\$70 per tonne by November, averaging US\$262.32 per tonne over the year. In early 2009, however, prices collapsed as demand fell sharply and the global recession took effect and they were reported to be close to zero at one point. Prices had recovered to around US\$30 per tonne by the end of 2009.

Sulphur and Pyrites

Sulphur and pyrites - EU32 trade in 2008

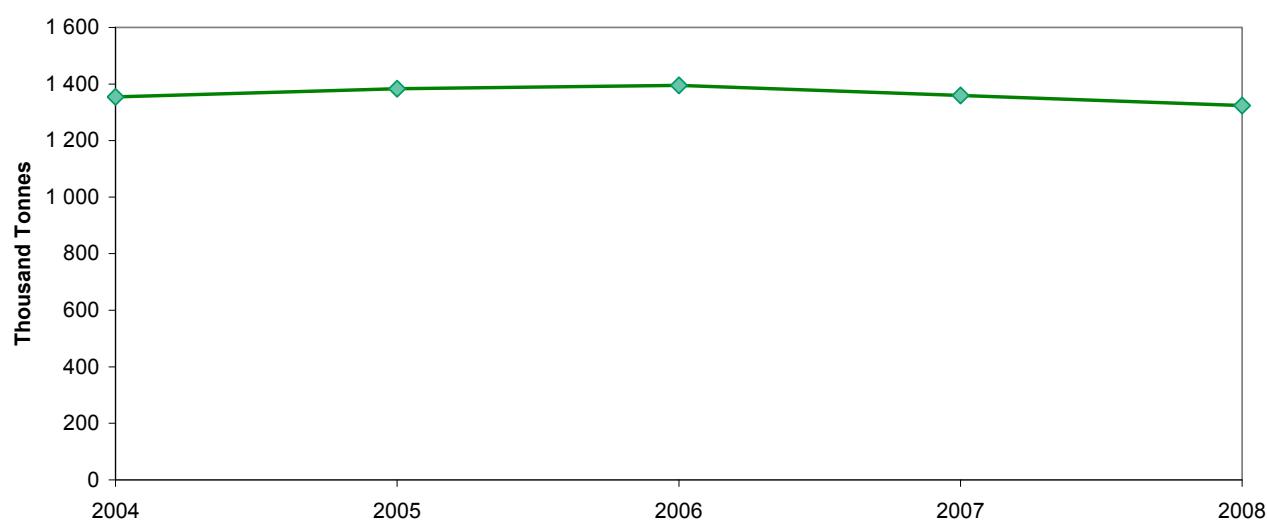

Talc

- Talc is a soft hydrous magnesium silicate mineral. It is frequently coloured by the presence of iron-bearing minerals and trace elements but usually turns white when finely ground. The familiar use of talc as a cosmetic powder is minor compared to industrial usage. Talc is chiefly used as a filler in paint, plastics, pharmaceuticals, adhesives and rubber. It is also extensively used in ceramics manufacture and as a filler and coater in the paper industry.
- During 2008 the largest world producer was China with an estimated 26 per cent of world production. The EU32 countries contributed 17 per cent to the world total and the largest producer was Finland, which accounted for 40 per cent of EU32 production.
- Talc is traded in a variety of forms and, as a result of widespread production, markets are very stable. During 2008 and 2009 prices ranged from US\$259 per tonne to US\$460 per tonne depending on grade.

Talc - EU32 trade in 2008

Tantalum and niobium

- Tantalum and niobium are produced from their ores, sometimes combined in one mineral. Tantalum is also produced from tin refinery slags. Tantalum is a heavy, very hard, ductile metallic element that has a very high melting point (2996°C) and is strongly resistant to chemical attack. It is used chiefly in electronic applications, especially in miniature capacitors, such as those in mobile telephones. Niobium is a soft and ductile metallic element that is used mainly in special steels and superalloys.
- World production of tantalum in 2008 was dominated by Australia (approximately 47 per cent) and the largest producer of niobium ores was Brazil (> 90 per cent). There was no production in the EU32, which is entirely import dependent.
- Tantalum is normally traded in oxide form (tantalite). During 2008 the average price for tantalite (Europe 25%/40% basis) was US\$35 per pound Ta₂O₅.

Note(s)

(1) Metal traded in ferro-alloy form is included under iron, steel and ferro-alloys

Tin

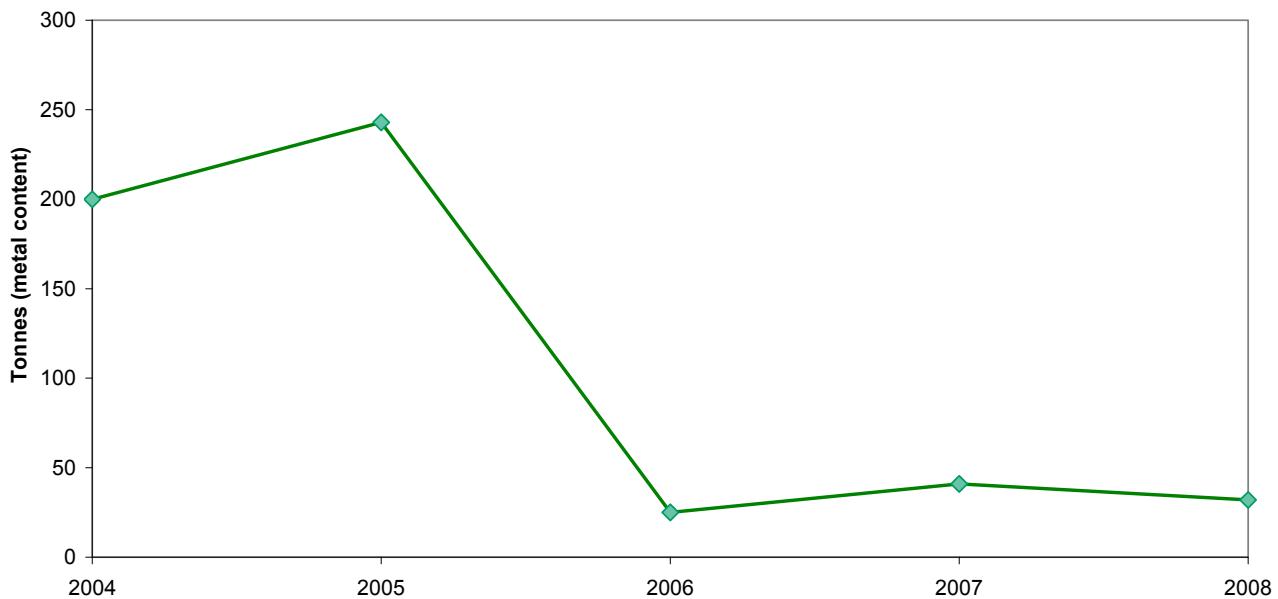

- Tin is a malleable and ductile metal that is resistant to corrosion. The chief use of tin is to coat metals that are more susceptible to corrosion, especially steel. It is also widely used as an alloying agent (i.e. with lead to make pewter) and its use in solders is rapidly growing as it replaces lead. Tin chemicals are used as fungicides and other biocides.
- World mine production is dominated by China with 45 per cent of the world total in 2008, while mine production from the EU32 countries is limited to a small amount from Portugal.
- The LME tin price increased sharply during the early part of 2008, reaching US\$24 052 per tonne in May before falling back to US\$11 228 per tonne by the end of the year. Prices remained low at the start of 2009, falling slightly further to US\$10 670 per tonne in March, but subsequently recovered to around US\$15 000 per tonne by the middle of the year. For the remainder of 2009 prices were relatively flat, ending at US\$15 539 per tonne.

Note(s)

(1) In this table the term 'unwrought' tin corresponds to item 8001 of the Harmonised System and comprises ingots, pigs, unwrought bars, sticks, etc.

(a) Including alloys

Titanium minerals

- The titanium minerals ilmenite and rutile are the main sources of titanium, a low density, strong and corrosion resistant metal that is important in the aerospace industry. However, the chief use (94 per cent) of titanium minerals is in the form of titanium dioxide, a white pigment used in paint, plastics, rubber and paper.
- In 2008 Canada was the world's largest producer of titanium minerals, followed by Australia and South Africa. Together these three countries produced 58 per cent of the world total. EU32 production is restricted to Norway, which produced about seven per cent of the world total.
- For much of 2008, ilmenite (Australian, min 54% TiO₂, F.O.B., bulk concentrates) traded between US\$80.00 per tonne and US\$136.50 per tonne, but prices fell at the end of the year to the range US\$75.00–US\$80.00 per tonne. By the end of 2009 the price was between US\$60.00 per tonne and US\$85.00 per tonne. Rutile, which has a higher TiO₂ content (Australian concentrate, min. 95% TiO₂ F.O.B.), traded between US\$480 per tonne and US\$550 per tonne throughout 2008 and 2009.

Note(s)

- (1) Significant quantities of titanium slag are traded, but it is not always possible to identify this material in national trade accounts
- (2) So far as possible, the term 'oxides', as used in this table, includes oxides and oxide based pigments classified under Harmonised System items 2823 and 3206.10
- (3) Metal traded in ferro-alloy form is included under iron, steel and ferro-alloys

Titanium - EU32 trade in 2008

Tungsten

- Tungsten is a corrosion-resistant metallic element with an extremely high melting point. Its largest use is as cemented carbides in cutting tools; it is also used as an alloying agent with steel to make high-speed tool steel, and in superalloys. Its most familiar use is in light bulb filaments.
- China was the world's largest tungsten producer in 2008, with 76 per cent of the world total. Tungsten was produced in Austria, Portugal and Spain but overall the EU32 contributed less than four per cent to the world total.
- Tungsten is traded in several forms but the bulk of exports were from China, and thus the largest component of international trade, was of ammonium paratungstate (APT). Prices for APT (European free market) varied between US\$232 per tonne and US\$256 per tonne throughout 2008, but fell during the first part of 2009 reaching a low of US\$173–US\$200 per tonne in July. Prices subsequently recovered slightly to end 2009 in the range US\$185 per tonne to US\$210 per tonne.

Note(s)

- (1) Significant amounts of tungsten are traded in the forms of ammonium paratungstate (APT) and carbide. Though statistics are included where available, most countries do not separately distinguish these forms in their trade accounts
- (2) Metal traded in ferro-alloy form is included under iron, steel and ferro-alloys

Vanadium

- Vanadium is a soft, ductile, metallic element that is very corrosion resistant. The chief use is as an additive in alloy steels where it imparts strength and corrosion resistance. Other uses are in titanium alloys and as a catalyst.
- Mine production is confined to four countries, of which Russia (estimated 40 per cent of world total) and South Africa (30 per cent of world total) are the largest producers. There is no EU32 mine production. In the USA vanadium is a significant by-product from the refining of heavy crude oils.
- Vanadium is traded chiefly as vanadiferous slags and other residues, vanadium pentoxide and ferro-vanadium. Prices for vanadium pentoxide increased sharply at the start of 2008 from US\$7.40–US\$7.90 per pound and remained in the range US\$13.00–US\$18.20 per pound until October. In the latter part of 2008 prices fell back and ended the year at US\$6.50–US\$7.00 per pound. Prices continued to fall during the first part of 2009, reaching a low of US\$3.60–US\$4.10 per pound in April, but then recovered to end the year at US\$6.00–US\$6.70 per pound.
- Prices for ferro-vanadium followed a roughly similar trend, increasing at the start of 2008 from around US\$40–US\$42 per kilogram, then remaining between US\$60–US\$90 per kilogram through to October, before falling back to finish the year at about US\$28–US\$30 per kilogram. Prices continued to fall during the first part of 2009, reaching a low of US\$18–US\$20 per kilogram in May, and then rising to US\$33–US\$35 per kilogram in August. However, prices for ferro-vanadium fell again to end 2009 at US\$20–US\$23 per kilogram.

 (2) Metal traded in ferro-alloy form is included under iron, steel and ferro-alloys

(a) BGS estimates, based on known exports from certain countries

Zinc

- Zinc is a metal that is brittle at ordinary temperatures but malleable at temperatures above 100°C. It is corrosion resistant and this property is exploited in its chief use as a steel coating (galvanising). Its other main uses are as zinc die-castings and alloyed with copper to make brass, which is widely used in the electrical, engineering and construction industries.
- Zinc is produced by many countries from mines, or in refineries that process imported zinc concentrates. China was the world's largest mine producer during 2008 with 27 per cent of the total. Australia and Peru are also major producers. The Republic of Ireland was the largest mine producer in the EU32 with 44 per cent of the EU32 total, although overall the EU32 contributed less than eight per cent to the world total. A number of EU32 countries have major zinc refineries.
- Prices for zinc dropped significantly in 2008 from US\$2500 per tonne in January to about US\$1100 per tonne by the end of the year. However, during 2009 they more than doubled from US\$1220 per tonne in January to around US\$2500 per tonne by the end of the year.

Zirconium minerals

- The mineral zircon (zirconium silicate) is the principal zirconium commodity. Due to its very high melting temperature and chemical stability, it is used as a refractory in furnace and ladle linings, foundry sands and ceramic manufacture. Zirconium metal manufacture is a very small part of total output.
- Zircon is recovered from heavy mineral sands, typically as a co-product with titanium minerals, and the relative rarity of large deposits restricts production to only a few countries. The largest producers in 2008 were Australia (39 per cent) and South Africa (29 per cent).
- The price for zircon sand (Australian bulk F.O.B.) ranged from US\$725–US\$800 per tonne for much of 2008. From October 2008 to March 2009 the price rose to US\$900 per tonne and it remained in the range from US\$880–US\$900 per tonne for the rest of 2009.

Zirconium concentrates - EU32 trade in 2008

Borates

- Borates is a general term for a range of boron-containing minerals of which borax (tincal), ulexite, colemanite and datolite are the most commercially significant. These minerals are processed via boron trioxide to boric acid. The chief use of borate minerals is in glass manufacture (in particular fibreglass) and ceramics.
- Economic concentrations form in unusual geological environments and so production is restricted to a few countries. Of these, Turkey (37.5 per cent of world production) was the largest in the world in 2008 and was the only EU32 producer.
- Borates are traded in a variety of forms. The price of Argentinian lump colemanite (F.O.B. 40–42% B₂O₃) was US\$400–US\$450 per tonne throughout much of 2008 but rose slightly at the end of the year to US\$420–US\$460 per tonne. However, during the first part of 2009 prices fell back to US\$370–US\$410 per tonne, where they remained for the rest of the year.

Production of borates

Country	2004	2005	2006	2007	2008
Turkey	1 727 000	2 087 000	2 373 345	1 997 163	2 139 224

Nepheline syenite

- Nepheline syenite is an igneous rock composed chiefly of feldspar and nepheline (one of a family of minerals called feldspathoids). The chief uses are similar to those for feldspar, i.e. in the manufacture of glass, in ceramics and as a filler.
- Economic concentrations form in rare geological environments and only four countries produce nepheline syenite. Russia was the largest known producer in 2008, followed by Canada and Norway. Iran is also believed to produce nepheline syenite but the production quantity in 2008 was not available.
- Norwegian nepheline syenite (bulk F.O.L., UK port, glass grade, 0.5mm) traded at £97 per tonne throughout 2008 and the first part of 2009. Prices for the latter part of 2009 were not published.

Production of nepheline syenite

Country	2004	2005	2006	2007	2008
Norway	329 000	320 000	312 000	312 000	346 000

Perlite

- Perlite is a silicate mineral that results from the alteration of natural glass with the chemical composition of granite. Upon heating the mineral swells and dewater — resulting in a sudden increase in volume accompanied by a decrease in density. It has remarkable thermal insulation properties, porosity, chemical stability, low flammability, high heat resistance and high sound absorption. It is chiefly used in building materials.
- More than 20 countries produce perlite. Greece is believed to be the largest perlite producer in the world, followed by China and the USA.
- Perlite can have a wide range of properties and shipments are individually assessed according to specification. Thus, the price range is large. During 2008 raw perlite (bulk, F.O.B. Turkey) traded at US\$40–US\$45 per tonne, rising to US\$55–US\$65 per tonne by the end of the year. In 2009 it remained at the same level until November when the lower end of the range rose further to US\$60–US\$65 per tonne. Milled filter-grade perlite (ex-works USA) traded at US\$600–US\$800 per tonne in 2009.

Selenium metal

- Selenium is a light, weakly toxic, metalloid. Selenium has a wide range of uses; the largest is in glass-making where it acts as a decolouriser, and it is also used in ceramics, pigments, electronics, animal feed supplement and in base-metal alloys. Its former major use in photocopiers has declined as it has been replaced by other materials.
- Selenium is most commonly produced as a by-product of copper refining. Thus, production tends to occur in the countries that produce significant amounts of refined copper. The largest world producer in 2008 was Japan. In the EU32 countries, Belgium and Sweden are the largest producers.
- The price for selenium metal increased at the start of 2008 from US\$30–US\$34 per pound in January to US\$37–US\$39 per pound in March, before it fell heavily to finish 2008 at US\$18–US\$22 per pound. The price remained at that level until July 2009 when it rose to US\$29–US\$31 per pound by September. It subsequently fell back slightly to end 2009 at US\$25–US\$27 per pound.

Strontium minerals

- Strontium is a soft metallic element. The most common strontium mineral is celestite (strontium sulphate). This is frequently converted into strontium carbonate before marketing. The dominant use of strontium is (in oxide form) in the faceplate glass of cathode ray tubes where it blocks X-ray emissions. Strontium compounds are also used in pigments, pyrotechnics and fluorescent tubes. Strontium metal has only very minor uses.
- Only a small number of countries produce strontium minerals. China is believed to be the world's largest producer with nearly 80 per cent of world production. In the EU32, Spain and Turkey are the only known producers, contributing nearly 16 per cent to the world total.
- For much of 2008, celestite (Turkish, 96% SrSO₄) traded at between US\$65–US\$80 per tonne. In October 2008 the price rose to US\$90–US\$105 per tonne, where it remained throughout 2009.

Production of strontium minerals

Country	2004	2005	2006	2007	2008
Spain	206 001	336 630	280 195	142 512	138 590
Turkey	* 77 000	* 18 000	* 6 300	* 4 200	* 1 600

Note(s)

(1) In addition to the countries listed, Germany and Poland are believed to produce strontium minerals

Uranium

- Uranium is a dense metallic element. It is chiefly used as the fuel source for nuclear power stations. Uranium ore is milled and processed into 'yellowcake' (a uranium oxide), which is the chief form in international trade. Yellowcake is converted to uranium hexafluoride, which is then enriched to enable it to be used as a fuel.
- Canada was the world's largest mine producer during 2008, accounting for 20 per cent of the world total. Kazakhstan was the second largest producer followed by Australia, both contributing 19 per cent to world production. In the EU32, a small amount of uranium was mined in the Czech Republic. In addition there was minor production from Romania and Germany.
- Over 80 per cent of uranium is sold under long-term contracts, however, a spot market has been in existence for several years and this is frequently referred to when negotiating prices for long-term contracts. The spot market price continued to fall throughout 2008, ending the year at about US\$51 per pound. In 2009 it fell further to reach a three-year low of US\$42 per pound before recovering slightly to end the year at US\$45 per pound. The long-term price also fell in 2009 but remained higher than the spot price and ended 2009 at US\$60 per pound.

Mine production of uranium

EU32 Total (U ₃ O ₈ equivalent)	710	696	635	519	481

Note(s)

(1) Excluding uranium production from decommissioning operations in France, Germany and Spain

Wollastonite

- Wollastonite (calcium metasilicate) is a commercially important mineral because of its bladed (acicular) crystals. It is used as filler in plastics, ceramics, paint and friction products and as an asbestos substitute.
- Production is restricted to a handful of countries, of which China is the largest in 2008 with an estimated 55 per cent of world production. Spain and Finland were the only known EU32 producers, together contributing four per cent to world production.
- Wollastonite is traded on the basis of the aspect ratio of its crystals and by mesh size. Prices were stable throughout 2008 and 2009 at between US\$50 per tonne and US\$105 per tonne depending on grade.
